MAX44246ASA+T**

MAX44241/MAX44243/MAX44246

36V, Low-Noise, Precision, Single/Quad/Dual Op Amps

General Description

The MAX44241/MAX44243/MAX44246 are 36V, ultra-precision, low-noise, low-drift, single/quad/dual operational amplifiers that offer near-zero DC offset and drift through the use of patented chopper stabilized and auto-zeroing techniques. This method constantly measures and compensates the input offset, eliminating drift over time and temperature and the effect of $1/f$ noise. These single/quad/dual devices feature rail-to-rail outputs, operate from a single 2.7V to 36V supply or dual $\pm 1.35V$ to $\pm 18V$ supplies, and consume only 0.42mA per channel, with only $9nV/\sqrt{Hz}$ input-referred voltage noise.

The ICs are available in 8-pin μ MAX® or SO packages and are rated over the $-40^{\circ}C$ to $+125^{\circ}C$ temperature range.

Applications

Transducer Amplifiers	Battery-Powered Equipment
Load Cell Amplifiers	PLC Analog I/O Modules
Precision Instrumentation	

Benefits and Features

- ◆ **Reduces Noise-Sensitive Precision Applications**
 - Low $9nV/\sqrt{Hz}$ Noise at 1kHz
 - Integrated EMI Filter
- ◆ **Eliminates Cost of Calibration with Increased Accuracy and Patented Auto-Zero Circuitry**
 - Ultra-Low Input V_{OS} : $5\mu V$ (max)
 - Low $20nV/^{\circ}C$ (max) of Offset Drift
- ◆ **Suitable for High-Bandwidth Applications**
 - $1\mu s$ Fast Settling Time
 - 5MHz Gain-Bandwidth Product
- ◆ **Low 0.55mA Per Channel (max) Quiescent Current**
- ◆ **Wide Supply for High-Voltage Front-Ends**
 - 2.7V to 36V Supply Range
- ◆ **Rail-to-Rail Output**

Ordering Information appears at end of data sheet.

MAX44241/MAX44243/MAX44246

36V, Low-Noise, Precision, Single/Quad/Dual Op Amps

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{DD} to GND)	-0.3V to +40V	8-Pin SO (derate 7.60mW/°C above +70°C).....	606.1mW
All Other Pins.....	(GND - 0.3V) to (V_{DD} + 0.3V)	14-Pin SO (derate 12.30mW/°C above +70°C).....	987.7mW
Short-Circuit Duration, OUTA, OUTB to Either Supply Rail.....	1s	14-Pin TSSOP (derate 10mW/°C above +70°C).....	796.8mW
Continuous Input Current (Any Pin)	20mA	Operating Temperature Range	-40°C to +125°C
Differential Input Current.....	±20mA	Junction Temperature	+150°C
Differential Input Voltage (Note 1).....	±6V	Storage Temperature Range.....	-65°C to +150°C
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)		Lead Temperature (soldering, 10s)	+300°C
5-Pin SOT23 (derate 3.9mW/°C above +70°C).....	312.6mW	Soldering Temperature (reflow)	+260°C
8-Pin μ MAX (derate 4.8mW/°C above +70°C).....	387.8mW		

Note 1: The amplifier inputs are connected by internal back-to-back clamp diodes. In order to minimize noise in the input stage, current-limiting resistors are not used. If differential input voltages exceeding $\pm 1\text{V}$ are applied, limit input current to 20mA.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS (Note 2)

μ MAX	SOT23		
Junction-to-Ambient Thermal Resistance (θ_{JA})	206.3°C/W	Junction-to-Ambient Thermal Resistance (θ_{JA})	255.9°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	42°C/W	Junction-to-Case Thermal Resistance (θ_{JC})	81°C/W
SO-8	TSSOP		
Junction-to-Ambient Thermal Resistance (θ_{JA})	132°C/W	Junction-to-Ambient Thermal Resistance (θ_{JA})	100.4°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	38°C/W	Junction-to-Case Thermal Resistance (θ_{JC})	30°C/W
SO-14			
Junction-to-Ambient Thermal Resistance (θ_{JA})	81°C/W		
Junction-to-Case Thermal Resistance (θ_{JC})	32°C/W		

Note 2: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

ELECTRICAL CHARACTERISTICS

MAX44241/MAX44243/MAX44246

36V, Low-Noise, Precision, Single/Quad/Dual Op Amps

Detailed Description

The MAX44241/MAX44243/MAX44246 are high-precision amplifiers that provide below 5 μ V of maximum input-referred offset and low flicker noise. These characteristics are achieved by using a combination of proprietary auto-zeroing and chopper stabilized techniques. This combination of auto-zeroing and chopping ensures that these amplifiers give all the benefits of zero-drift amplifiers, while still ensuring low noise, minimizing chopper spikes, and providing wide bandwidth. Offset voltages due to power ripple/spikes as well as common-mode variation, are corrected resulting in excellent PSRR and CMRR specifications.

Noise Suppression

Flicker noise, inherent in all active devices, is inversely proportional to frequency present. Charges at the oxide-silicon interface that are trapped-and-released by MOSFET oxide occurs at low frequency more often. For this reason, flicker noise is also called 1/f noise. The MAX44241/MAX44243/MAX44246 eliminate the 1/f noise internally, thus making them ideal choices for DC or sub-Hz precision applications. The 1/f noise appears as a slow varying offset voltage and is eliminated by the chopping technique used.

Electromagnetic interference (EMI) noise occurs at higher frequency, resulting in malfunction or degradation of electrical equipment. The ICs have an input EMI filter to avoid the output being affected by radio frequency interference. The EMI filter composed of passive devices, presents significant higher impedance to higher frequency.

Applications Information

ADC Buffer Amplifier

The MAX44241/MAX44243/MAX44246 have low input offset voltage, low noise, and fast settling time that make these amplifiers ideal for ADC buffers. Weight scales are one application that often requires a low-noise, high-voltage amplifier in front of an ADC. The *Typical Operating*

Figure 1. Low-Side Current Sensing

Circuit details an example of a load cell and amplifier driven from the same ± 10 V supplies, along with the MAX11211 18-bit delta sigma ADC. Load cells produce a very small voltage change at their outputs; therefore driving the excitation source with a higher voltage produces a wider dynamic range that can be measured at the ADC inputs.

The MAX11211 ADC operates from a single 2.7V to 3.6V analog supply, offers 18-bit noise-free resolution and 0.86mW power dissipation. The MAX11211 also offers > 100dB rejection at 50Hz and 60Hz. This ADC is part of a family of 16-, 18-, 20-, and 24-bit delta sigma ADCs with high precision and < 1mW power dissipation.

The low input offset voltage and low noise of MAX44241/MAX44243/MAX44246 allow a gain circuit to precede the MAX11211 without losing any dynamic range at the ADC. See the *Typical Operating Circuit*.

Precision Low-Side Current Sensing

The ICs' ultra-low offset voltage and drift make them ideal for precision current-sensing applications. Figure 1 shows the ICs in a low-side current-sense configuration. This circuit produces an accurate output voltage, V_{OUT} equal to $I_{LOAD} \times R_{SENSE} \times (1 + R_2/R_1)$.

MAX44241/MAX44243/MAX44246

36V, Low-Noise, Precision, Single/Quad/Dual Op Amps

Layout Guidelines

The MAX44241/MAX44243/MAX44246 feature ultra-low offset voltage and noise. Therefore, to get optimum performance follow the following layout guidelines.

Avoid temperature gradients at the junction of two dissimilar metals. The most common dissimilar metals used on a PCB are solder-to-component lead and solder-to-board trace. Dissimilar metals create a local thermocouple. A variation in temperature across the board can cause an additional offset due to Seebeck effect at the solder junctions. To minimize the Seebeck effect, place the amplifier away from potential heat sources on the board, if possible. Orient the resistors such that both the ends are heated equally. It is a good practice to match the input signal path to ensure that the type and number of thermoelectric junctions remain the same. For example, consider using dummy 0Ω resistors oriented in such a way that the thermoelectric sources, due to the real resistors in the signal path, are cancelled. It is recommended to flood the PCB with ground plane. The ground plane ensures that heat is distributed uniformly reducing the potential offset voltage degradation due to Seebeck effect.
