DESCRIPTION

The Si9712 combines low on-resistance with slow ramp time and smart switching for overall best performance in integrated PC Card interface switches.

The Si9712 operates off the 5-V supply and has built-in level shifting for gate drive. Internal logic protects against an external control input error that would short 5 V to the 3.3-V supply. This protection logic also allows the Si9712 to be configured for positive or negative control logic for compatibility with a variety of PC Card controllers. These control inputs are CMOS logic compatible and can be driven to 3.3 V or 5 V.

The Si9712 complies with the release of the PC Card standard by suppling 0 V, 12 V, and V_{CC} to the V_{pp} output and 0 V, 3.3 V, and 5 V to the V_{CC} output. The V_{CC} ramp time is user programmable with an external capacitor connected to the SR pin.

The PC Card switch is packaged in a narrow body SO-16 package and is rated over the industrial temperature range −40 to 85°C.

The Si9712 is available in both standard and lead (Pb)-free packages.

a. Turn on of switch 1 and 2 are internally delayed until after V_{CC} is valid. See Figure 3.
b. Shaded lines are error conditions for PC Card applications, however, switches default to the states shown.
