**Warning**

- The contents in this document are subject to changes, for improvement and other purposes, without notice.
- Be sure to check the delivery specifications before using these products.
- The operation and circuit examples in this document are provided for reference purposes only. Sanken assumes no liability for violation of industrial property, intellectual property, or other rights of Sanken or third parties, that stem from these examples.
- The user must take responsibility for considering and determining which objects the products in this document are used with.
- Although we will continue to improve the quality and reliability of our products, semiconductor products, by their nature, have certain fault and failure rates. The user must take responsibility for designing and checking to secure the device and system so that a part failure may not lead to human injury, fire, damages, or other losses.
- The products in this document are intended for normal electronic devices (such as home appliances, office equipment, communication terminals, or measurement devices). If you are considering using our products for a device that requires high reliability (such as transport machines and their control units, traffic light control systems, disaster prevention, and security equipment or any kind of safety equipment), make sure that you consult our sales representative.  
Do not use these products for devices that require extremely high reliability (such as aerospace instruments, nuclear power control units, or life support systems).
- The products in this document are not designed to be radiation-proof.
- The contents in this document must not be transcribed or copied without our written consent.

## 1-1 Power Management ICs

### 1-1-1 Power Factor Correction (PFC) ICs

#### Control ICs

##### ● Continuous Conduction Mode (CCM) PFC Control IC

For high power and high efficiency applications, with brown-in and brown-out functions

Series Name	Part Number	Oscillation Frequency	Package
SSC2000	SSC2001S	Fixed to 65kHz	SOP8

##### ● Interleaved Discontinuous Conduction Mode (DCM) PFC Control IC

8-pin package, minimum number of discrete components, low noise, and low ripple

Series Name	Part Number	Maximum on time	Package
SSC2100	SSC2101S	15 $\mu$ s	SOP8
	SSC2102S	20.7 $\mu$ s	SOP8

### 1-1-2 AC/DC Converter ICs

#### ● PWM type

<STR-3A100 Series>

- For small power applications
- Low noise, low standby power (Input power  $P_{IN}$  < 15mW at no load)

Part Number	Oscillation Frequency	MOSFET		Overvoltage and Thermal Protection Operation	Package
		V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)		
STR3A151	67kHz	650V	4.0 $\Omega$	Latch	DIP8
STR3A152			3.0 $\Omega$		
STR3A153			1.9 $\Omega$		
STR3A154			1.4 $\Omega$		
STR3A155			1.1 $\Omega$		
STR3A151D	67kHz	650V	4.0 $\Omega$	Auto restart	
STR3A152D			3.0 $\Omega$		
STR3A153D			1.9 $\Omega$		
STR3A154D			1.4 $\Omega$		
STR3A155D			1.1 $\Omega$		
STR3A161HD	100kHz	700V	4.2 $\Omega$	Auto restart	
STR3A162HD			3.2 $\Omega$		
STR3A163HD			2.2 $\Omega$		

<STR-A6000 Series>

- For small power applications
- Low noise, low standby power (Input power  $P_{IN}$  < 25mW at no load)
- Brown-in and brown-out functions

Part Number	Oscillation Frequency	MOSFET		Package
		V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)	
STR-A6051M	67kHz	650V	3.95 $\Omega$	DIP8
STR-A6052M			2.8 $\Omega$	
STR-A6053M			1.9 $\Omega$	
STR-A6079M			800V	
STR-A6059H	100kHz	700V	6 $\Omega$	
STR-A6061H			3.95 $\Omega$	
STR-A6062H			2.8 $\Omega$	
STR-A6069H			6 $\Omega$	
STR-A6061HD*	100kHz	700V	3.95 $\Omega$	
STR-A6062HD*			2.8 $\Omega$	
STR-A6063HD*			2.3 $\Omega$	
STR-A6069HD*			6 $\Omega$	

- In addition to normal overcurrent protection, overcurrent protection that operates in the case of a short circuit at the output coil has been added. This overcurrent protection operates during the leading edge blanking period.

<STR-V600 Series>

- Low height, at least 4 mm of creepage isolation between high and low terminal tips
- Low noise, low standby power (Input power  $P_{IN}$  < 25mW at no load)
- SIP8 package version of STR-A6000

Part Number	Oscillation Frequency	MOSFET		Package
		V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)	
STR-V653	67kHz	650V	1.9 $\Omega$	SIP8

<STR2W100D Series>

- Low noise, low standby power (Input power  $P_{IN}$  < 25mW at no load)

Part Number	Oscillation Frequency	MOSFET		Package
		V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)	
STR2W152D	67kHz	650V	3.0 $\Omega$	TO220F-6
STR2W153D			1.9 $\Omega$	

## &lt;STR-W6000S Series&gt;

- Low noise, low standby power (Input power  $P_{IN}<30mW$  at no load)
- Brown-in and brown-out functions

Part Number	Oscillation Frequency	MOSFET		Package
		$V_{DSS}$ (MIN)	$R_{DS(ON)}$ (MAX)	
STR-W6051S	67kHz	650V	3.95 $\Omega$	TO220F-6
STR-W6052S			2.8 $\Omega$	
STR-W6053S			1.9 $\Omega$	

## &lt;STR-W6200D Series&gt;

- Low noise, low standby power (Input power  $P_{IN}<40mW$  at no load)
- External latch protection (ELP) function

Part Number	Oscillation Frequency	MOSFET		Package
		$V_{DSS}$ (MIN)	$R_{DS(ON)}$ (MAX)	
STR-W6251D	67kHz	650V	3.95 $\Omega$	TO220F-6
STR-W6252D			2.8 $\Omega$	
STR-W6253D			1.9 $\Omega$	

### ●Pulse ratio control (PRC) type with off-time period fixed (originated by Sanken Electric)

## &lt;STR-A6100 Series&gt;

- For small power applications
- Low noise, low standby power

Part Number	Fixed off-time period	MOSFET		Auto standby function	Package
		$V_{DSS}$ (MIN)	$R_{DS(ON)}$ (MAX)		
STR-A6131	8 $\mu$ s	500V	3.95 $\Omega$	Yes	DIP8
STR-A6132			2.62 $\Omega$		
STR-A6159		650V	6 $\Omega$		
STR-A6151			3.95 $\Omega$		
STR-A6169	800V	19.2 $\Omega$	No		
STR-A6131M	650V	500V		3.95 $\Omega$	
STR-A6159M		6 $\Omega$			
STR-A6151M		3.95 $\Omega$			
STR-A6153E		1.9 $\Omega$			

## &lt;STR-V100 Series&gt;

- Low height, at least 4 mm of creepage isolation between high and low terminal tips
- Low noise, low standby power
- SIP8 package version of STR-A6100

Part Number	Fixed off-time period	MOSFET		Package
		$V_{DSS}$ (MIN)	$R_{DS(ON)}$ (MAX)	
STR-V152	8 $\mu$ s	650V	2.8 $\Omega$	SIP8
STR-V153	11.5 $\mu$ s		2 $\Omega$	

### ●Quasi-resonant type

## &lt;STR-Y6700 Series&gt;

- High efficiency in full load range
- Low noise, low standby power

Part Number	MOSFET		Package
	$V_{DSS}$ (MIN)	$R_{DS(ON)}$ (MAX)	
STR-Y6735	500V	0.8 $\Omega$	TO220F-7
STR-Y6753	650V	1.9 $\Omega$	
STR-Y6754		1.4 $\Omega$	
STR-Y6763	800V	3.5 $\Omega$	
STR-Y6765		2.2 $\Omega$	
STR-Y6766		1.7 $\Omega$	

## &lt;STR-Y6400 Series&gt;

- High efficiency in full load range
- Low noise, low standby power
- Mode change delay time adjustable

Part Number	MOSFET		Package
	$V_{DSS}$ (MIN)	$R_{DS(ON)}$ (MAX)	
STR-Y6453	650V	1.8 $\Omega$	TO220F-7
STR-Y6456		0.73 $\Omega$	
STR-Y6473	850V	3.6 $\Omega$	
STR-Y6476		1.3 $\Omega$	

## 1-1-2 AC/DC Converter ICs

### <STR-L6400 Series>

- Low height, at least 6.5 mm of creepage isolation between high and low terminal tips
- High efficiency in full load range, low noise, and low standby power
- SIP10 package version of STR-Y6400

Part Number	MOSFET		Package
	V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)	
STR-L6472	850V	6.5Ω	SIP10

### <STR-L400 Series>

- Low height, at least 6.5 mm of creepage isolation between high and low terminal tips
- Low noise, high efficiency

Part Number	MOSFET		Package
	V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)	
STR-L451	650V	3.95Ω	SIP10
STR-L472	900V	7.7Ω	

### <STR-W6700 Series>

- High efficiency in full load range
- Low noise, undervoltage lockout (UVLO) standby function

Part Number	MOSFET		Auto burst operation	Bottom-skip QR operation	Package
	V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)			
STR-W6734	500V	1.0Ω	Yes	Yes	TO220F-6
STR-W6735		0.57Ω			
STR-W6753		1.7Ω			
STR-W6754	650V	0.96Ω			
STR-W6756	0.73Ω				
STR-W6765	800V	1.8Ω	Yes	No	
STR-W6750F	650V	0.73Ω	No	Yes	
STR-W6723N	450V	1.4Ω			
STR-W6735N	500V	0.57Ω			
STR-W6756N	650V	0.73Ω			
STR-W6765N	800V	1.8Ω			

### <STR-X6700 Series>

- High efficiency in full load range
- Low noise, undervoltage lockout (UVLO) standby function

Part Number	MOSFET		Auto burst operation	Bottom-skip QR operation	Package
	V <sub>DSS</sub> (MIN)	R <sub>DS(ON)</sub> (MAX)			
STR-X6737	500V	0.36Ω	Yes	Yes	TO3PF-7
STR-X6756	650V	0.73Ω			
STR-X6757		0.62Ω			
STR-X6769		800V			
STR-X6750B	650V	0.62Ω	No	No	
STR-X6759B		0.385Ω			
STR-X6769B	800V	0.66Ω	Yes	No	
STR-X6750F	650V	0.62Ω			
STR-X6759F		0.385Ω			
STR-X6729	450V	0.189Ω	No	Yes	
STR-X6737M	500V	0.36Ω			
STR-X6757N	650V	0.62Ω			
STR-X6759N		0.385Ω			
STR-X6768N		800V			1.0Ω

### ● Current resonance type

- Half-bridge resonance
- High efficiency, low noise
- Brown-in and brown-out functions

Part Number	Package
SSC9512	DIP16
SSC9522S	SOP18

# Application Note

## Heat Dissipation and Reliability

The reliability of an IC is highly dependent on its operating temperature. Please be sure to apply silicone grease to the IC and to mount it to the heatsink with a proper mounting torque.

Heatsink design should pay particular attention to ensuring sufficient heat dissipation capacity.

In addition, please take into account the air convection in operation.

The reliability of discrete components such as capacitors and coils is closely related to temperature. A high operating temperature may reduce the service life. Exceeding the allowable temperature may burn the coils or damage capacitors. It is important to make sure that the temperature of output smoothing coils and input/output capacitors do not exceed their allowable levels during operation. With an adequate derating for the coils, minimize heat emission as far as possible. (For discrete components, refer to the individual user manuals.)

## Internal Power Dissipation

$P_D$  can be obtained from the following formula.

- For the device with built-in flywheel diode:

$$P_D = V_O \cdot I_O \left( \frac{100}{\eta\chi} - 1 \right)$$

- For the device with external flywheel diode:

$$P_D = V_O \cdot I_O \left( \frac{100}{\eta\chi} - 1 \right) - V_F \cdot I_O \left( 1 - \frac{V_O}{V_{IN}} \right)$$

Efficiency  $\eta\chi$  depends on the input/output conditions. Please refer to the efficiency characteristics of the devices. (Posted on the Web site.)

$V_O$ :	Output voltage
$V_{IN}$ :	Input voltage
$I_O$ :	Output current
$\eta\chi$ :	Efficiency(%)
$V_F$ :	Diode forward voltage

## Thermal Design

The maximum junction temperature  $T_{j(max)}$  given in the Absolute Maximum Ratings is specific to each product type and must be strictly observed. Thus, thermal design must consider the maximum power dissipation  $P_{D(max)}$ , which varies by the conditions of use, and the maximum ambient temperature  $T_{a(max)}$ .

To simplify thermal design,  $T_a$ - $P_D$  characteristic graphs are provided herein. Please observe the following steps for heatsink design:

- Obtain the maximum ambient temperature  $T_{a(max)}$ .
- Obtain the maximum power dissipation  $P_{D(max)}$ .
- Look for the intersection point on the  $T_a$ - $P_D$  characteristic graph and determine the size of the heatsink.

Although the heatsink size is now obtained, in actual applications, 10-to-20% derating factor is generally introduced. Moreover, the heat dissipation capacity of a heatsink highly depends on how it is mounted. Thus, it is recommended to measure the heatsink and case temperature in the actual operating environment.

Please refer to the  $T_a$ - $P_D$  characteristic graphs for respective product types.

## Recommended Silicone Grease

- Shin-Etsu Chemical Co., Ltd.: G746
- Momentive Performance Materials Inc.: YG-6260
- Dow Corning Toray Silicone Co., Ltd.: SC102

Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

## Others

- Devices can not be operated in parallel connection aiming for a larger current.
- Not applicable for the current boost or voltage step-up use.

$$P_D = V_O \cdot I_O \left( \frac{100}{\eta \chi} - 1 \right) - V_F \cdot I_O \left( 1 - \frac{V_O}{V_{IN}} \right)$$

The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

\*: Pin 5 is the ON/OFF pin. Soft start at power on can be performed with a capacitor connected to this pin.  
 The output can also be turned ON/OFF with this pin.  
 The output is stopped by setting the voltage of this pin to V<sub>SSL</sub> or lower.  
 ON/OFF-pin voltage can be changed with an open-collector drive circuit of a transistor.  
 When using both the soft-start and ON/OFF functions together, the discharge current from C<sub>3</sub> flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C<sub>3</sub> capacitance is large.  
 The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

\*: Pin 5 is the SS pin. Soft start at power on can be performed with a capacitor connected to this pin. The output can also be turned ON/OFF with this pin. The output is stopped by setting the voltage of this pin to  $V_{SSL}$  or lower. SS-pin voltage can be changed with an open-collector drive circuit of a transistor. When using both the soft-start and ON/OFF functions together, the discharge current from C3 flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C3 capacitance is large. The SS pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited. If the pin is not used, leave it open.

## Features

- Compact surface-mount package
- Input voltage range ( $V_{IN}$ ):  $V_O + 3$  to 31 V
- Oscillation frequency: 30 kHz, 350 kHz, 364 kHz
- High efficiency under light load
- High efficiency: 94% or higher
- Current mode control
- Stable with low-ESR ceramic output capacitors
- Built-in phase compensation component
- Output current: 1.5 A, 2 A, 4 A
- Reference voltage and accuracy of  $0.8 \text{ V} \pm 2\%$
- Overcurrent protection function that can be adjusted externally
- Output ON/OFF available
- Undervoltage lockout
- Soft start function

## Applications

\* Pin 5 is a soft start pin. Soft start at power on can be performed with a capacitor connected to this pin.

The output can also be turned ON/OFF with this pin.

The output is stopped by setting the voltage of this pin to V<sub>SSL</sub> or lower.

Soft-start pin voltage can be changed with an open-collector drive circuit of a transistor.

When using both the soft-start and ON/OFF functions together, the discharge current from C<sub>3</sub> flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C<sub>3</sub> capacitance is large.

The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

If this pin is not used, leave it open.

# SPI-8000A Series Surface Mount, Separate Excitation Step-down Switching Mode

## Features

- Surface-mount 16 pin package
- Output current: 3.0A
- High efficiency: 91% (at  $V_{IN} = 10V$ ,  $I_o = 1A$ ,  $V_o = 5V$ )
- Capable of downsizing a choke-coil due to IC's high switching frequency (250kHz). (Compared with conventional Sanken devices)
- The output-voltage-variable type can vary its output voltage from 1V to 14V because of its low reference voltage ( $V_{ref}$ ) of 1V.
- Wide Input Voltage Range (8 to 50V)
- Output ON/OFF available
- Built-in overcurrent and thermal protection circuits

 (Sanken)

Diode D1

- Be sure to use a Schottky-barrier diode for D1. If other diodes like fast recovery diodes are used, ICs may be destroyed because of the reverse voltage generated by the recovery voltage or ON voltage.

Choke coil L1

- If the winding resistance of the choke coil is too high, the efficiency may drop below the rated value.
- As the overcurrent protection starting current is about 4.5A, take care concerning heat radiation from the choke coil caused by magnetic saturation due to overload or short-circuited load.

Capacitors C1, C2

- As large ripple currents flow through C1 and C2, use high-frequency and low-impedance capacitors aiming for switching-mode-power-supply use. Especially when the impedance of C2 is high, the switching waveform may become abnormal at low temperatures. For C2, do not use a capacitor with an extremely low equivalent series resistance (ESR) such as an OS capacitor or a tantalum capacitor, which may cause an abnormal oscillation.

Resistors R2, R3

- R2 and R3 are the resistors to set the output voltage. Set their values so that IREF becomes approx. 2mA. Obtain R2 and R3 values by the following formula:

$$R2 = \frac{(V_{OUT} - V_{REF})}{I_{REF}} = \frac{(V_{OUT} - 1)}{2 \times 10^{-3}} (\Omega), R3 = \frac{V_{REF}}{I_{REF}} = \frac{1}{2 \times 10^{-3}} \approx 500 (\Omega)$$

©To create the optimum operating conditions, place the components as close as possible to each other.

■ Ta-Pd Characteristics

$$P_D = V_O \cdot I_O \left( \frac{100}{\eta\%} - 1 \right) - V_F \cdot I_O \left( 1 - \frac{V_O}{V_{IN}} \right)$$

Note 1: The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

Note 2: Thermal design for D1 must be considered separately.

V<sub>O</sub> : Output voltage  
 V<sub>IN</sub> : Input voltage  
 I<sub>O</sub> : Output current  
 η% : Efficiency (%)  
 V<sub>F</sub> : Diode D1 forward voltage

The output can also be turned ON/OFF with this pin. The output is stopped by setting the voltage of this pin to V<sub>SSL</sub> or lower. ON/OFF-pin voltage can be changed with an open-collector drive circuit of a transistor. When using both the soft-start and ON/OFF functions together, the discharge current from C<sub>3</sub> flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C<sub>3</sub> capacitance is large. The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited. If this pin is not used, leave it open.

<sup>1</sup>:"S" may be printed to the right of the marking (except SI-8090S, SI-8120S, SI-8150S).

<sup>2</sup>:Pin 5 is a soft start pin. Soft start at power on can be performed with a capacitor connected to this pin.

The output can also be turned ON/OFF with this pin.

The output is stopped by setting the voltage of this pin to V<sub>SSL</sub> or lower.

Soft-start pin voltage can be changed with an open-collector drive circuit of a transistor.

When using both the soft-start and ON/OFF functions together, the discharge current from C<sub>3</sub> flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C<sub>3</sub> capacitance is large.

The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

If this pin is not used, leave it open.

## ■ Features

- DIP8 package
- Introduction of current mode control method
- Output current: 3.5A
- High efficiency: 90% (Vo=5V)
- Built-in reference oscillator (350kHz)
- Built-in drooping-type overcurrent and thermal protection circuits
- Built-in soft start circuit
- Built-in on/off function (Active Hi)
- Low current consumption during off

## ■ Applications

- DVD recorder, FPD-TV
- Onboard local power supplies
- OA equipment

\*: Pin 5 is the SS pin. Soft start at power on can be performed with a capacitor connected to this pin. The output can also be turned ON/OFF with this pin. The output is stopped by setting the voltage of this pin to  $V_{SSL}$  or lower. SS-pin voltage can be changed with an open-collector drive circuit of a transistor. When using both the soft-start and ON/OFF functions together, the discharge current from C3 flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C3 capacitance is large. The SS pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited. If the pin is not used, leave it open.

## Features

- 2 regulators combined in 1 package
- Compact inline package
- Output current (0.5A × 2 outputs)
- Output voltage of Ch2 selectable from 4 levels
- Built-in flywheel diode (Schottky barrier diode)
- Requires only 7 discrete components (2 outputs)
- Internally-adjusted phase compensations and output voltages
- Built-in reference oscillator (125kHz) - Enables to downsize a choke-coil due to IC's high oscillating frequency. (Compared with conventional Sanken devices)
- Built-in overcurrent and thermal protection circuits
- Built-in soft start circuits (Output ON/OFF available)

### ■ Features

- 2 regulators combined in one package
- Output current: 1.5A × 2 (HSOP 16 Pin Surface mount package)
- High efficiency: TYP80% (SPI-8001TW), TYP78% (SPI-8002TW)
- Variable output voltage: 1.0 to 16V (SPI-8001TW), 1.0 to 24V (SPI-8002TW)
- Built-in reference oscillator (250kHz): Enables to downsize a choke-coil
- Low circuit current consumption:  $\leq 1\mu\text{A}$  (at output OFF)
- High accuracy reference voltage:  $\pm 1\%$
- Built-in foldback-overcurrent and thermal protection circuits
- Built-in ON/OFF circuit (soft start available) – per output

### ■ Applications

\*1: Electrical characteristics show the characteristic ratings guaranteed when operating the ICs under the measurement conditions described in the above table.

\*2: Efficiency is calculated from the following formula.

$$\eta (\%) = \frac{V_O \cdot I_O}{V_{IN} \cdot I_{IN}} \times 100$$

\*3: Pin 6 and pin 11 are the SS pins. Soft start at power on can be performed with capacitors connected to these pins. The outputs can also be turned ON/OFF with these pins. The outputs are stopped by setting the voltages of these pins to VSSL or lower. SS-pin voltages can be changed with open-collector drive circuits of transistors.

When using both the soft-start and ON/OFF functions together, the discharge currents from C4 and C5 flow into the ON/OFF control transistors respectively. Therefore, limit the currents securely to protect the transistors if C4 and C5 capacitances are large. The SS pins are pulled up to the power supply in the ICs, so applying the external voltages are prohibited.

Diodes Di1, Di2

- Be sure to use Schottky-barrier diodes for Di1 and Di2.
- If other diodes like fast recovery diodes are used, IC may be destroyed because of the reverse voltage generated by the recovery voltage or ON voltage.

Choke coils L1, L2

- If the winding resistance of the choke coil is too high, the efficiency may drop below the rated value.
- As the overcurrent protection starting current is about 2.0A, take care concerning heat radiation from the choke coil caused by magnetic saturation due to overload or short-circuited load.
- Use a closed-magnetic-path coil to prevent interference between the channels SWout1 and SWout2.

Capacitors C1, C2, C3

- As large ripple currents flow through C1, C2 and C3, use high-frequency and low-impedance capacitors suitable for switching mode power supplies. Especially when the impedance of C2 and C3 are high, the switching waveforms may become abnormal at low temperatures. For C2 and C3, do not use capacitors with extremely low equivalent series resistance (ESR) such as OS capacitors or tantalum capacitors, which may cause abnormal oscillation.

Resistors R1, R2, R3, R4

- R1, R2, R3 and R4 are resistors for setting output voltages. Set the resistors so that IREF is approx. 1 mA. For example, R1 and R2 can be calculated as shown below.

$$R1 = \frac{(VO1 - VREF1)}{IREF1} = \frac{(VO1 - V)}{1 \times 10^{-3}} (\Omega), R2 = \frac{VREF1}{IREF1} = \frac{1}{1 \times 10^{-3}} \approx 1(K\Omega)$$

© To create the optimum operating conditions, place the components as close as possible to each other.

Ta-Pd Characteristics

$$P_D = V_O \cdot I_O \left( \frac{100}{\eta\%} - 1 \right) - V_F \cdot I_O \left( 1 - \frac{V_O}{V_{IN}} \right)$$

- VO : Output Voltage
- VIN : Input Voltage
- IO : Output Current
- η% : Efficiency (%)
- VF : D1 Forward Voltage
- SJPB-H6...0.45V (IO=1A)

Note 1: The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

Note 2: Thermal design for D1 must be considered separately.

# SI-8511NVS Surface-Mount, Synchronous Rectifier Step-down Switching Mode Control ICs

## ■ Features

- Surface-mount package (TSSOP24)
- High efficiency due to synchronous rectification: 92% (at  $V_{IN} = 5V$ ,  $I_o = 1A$ ,  $V_o = 2.5V$ )
- Capable of downsize a choke-coil due to IC's high switching frequency (400kHz typ, On Time Control). (Compared with conventional Sanken devices)
- Low reference voltage ( $V_{ref}$ ) of 1.1V. The output voltage is variable from 1.1V to 6V.
- High-speed response to a load
- Compatible with low ESR capacitors
- Soft start and output ON/OFF available
- Built-in overcurrent and output-overvoltage protection circuits
- PWRGD function to indicate the output voltage status
- High precision reference voltage:  $1.1V \pm 1.2\%$

# Application Note

## Heat dissipation and Reliability

The reliability of an IC is highly dependent on its operating temperature. Please be sure to apply silicone grease to the IC and to mount it to the heatsink with a proper mounting torque.

Heatsink design should pay particular attention to ensuring sufficient heat dissipation capacity.

In addition, please take into account the air convection in operation.

## Calculating Internal Power Dissipation( $P_D$ )

$P_D$  is given by the following formula:

$$P_D = I_O \cdot [V_{IN(\text{mean})} - V_O]$$

Determine the size of the heatsink according to the relationship between allowable power dissipation and ambient temperature.

## Setting DC Input Voltage

The following is the waveform of a DC input voltage.

When setting the DC input voltage, please follow the instructions below:

- Make  $V_{IN(\text{min})} \geq [(\text{Output voltage}) + (\text{Minimum dropout voltage})]$
- Make  $V_{IN(\text{max})} \leq$  DC input voltage shown in the "Absolute Maximum Ratings"

## Thermal Design

The maximum junction temperature  $T_{J(\text{max})}$  given in the absolute maximum ratings is specific to each product type and must be strictly observed. Thus, thermal design must consider the maximum power dissipation  $P_{D(\text{max})}$ , which varies by the conditions of use, and the maximum ambient temperature  $T_{a(\text{max})}$ .

To simplify thermal design,  $T_a$ - $P_D$  characteristic graphs are provided herein.

Please observe the following steps for heatsink design:

1. Obtain the maximum ambient temperature  $T_{a(\text{max})}$ .
2. Obtain the maximum power dissipation  $P_{D(\text{max})}$ .
3. Look for the intersection point on the  $T_a$ - $P_D$  characteristic graph and determine the size of the heatsink.

Although the heatsink size is now obtained, in actual applications, 10-to-20% derating factor is generally introduced. Moreover, the heat dissipation capacity of a heatsink highly depends on how it is mounted. Thus, it is recommended to measure the heatsink and case temperature in the actual operating environment.

Please refer to the  $T_a$ - $P_D$  characteristic graphs for respective product types.

## Mounting Torque

SI-3000KF	} 0.588 to 0.686 [N•m] ( 6.0 to 7.0 [kgf•cm] )
SI-3000ZF	

## Recommended Silicone Grease

- Shin-Etsu Chemical Co., Ltd.: G746
- Momentive Performance Materials Inc.: YG-6260
- Dow Corning Toray Silicones Co., Ltd.: SC102

Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

## Others

- Devices can not be operated in parallel connection aiming for a larger current.
- Diodes for isolation purpose are provided in between input and ground, and also in between output and ground. They may be broken down if the device is reverse biased. In this case, please clamp the device with low  $V_F$  diodes to protect them.

## Rectifier Diodes for Power Supplies

To rectify the AC input voltage using rectifier diodes for power supplies, please use SANKEN rectifier diodes shown in the following list. (Please use a center-tap or bridge configuration in using stand-alone type diodes.)

- A monolithic ICs mounts an inner frame stage that is connected to the GND pin (pin 2). Therefore, enlarging the copper laminate area connected to the GND pin improves heat radiation effect.

- Obtaining the junction temperature  
 Measure the temperature Tc at the lead part of the GND pin (pin 2) with a thermocouple, etc. Then, substitute this value in the following formula to obtain the junction temperature.

$$T_j = P_D \times \theta_j - c + T_c \quad (\theta_j - c = 5^\circ\text{C/W})$$

C<sub>IN</sub>, C<sub>B</sub>: Input and bias capacitors (Approx. 0.1 to 10μF)

Required when the input line contains inductance or when the wiring is long.

C<sub>O</sub>: Output capacitor (47μF or larger)

SI-3010LLSL is designed to use a low ESR capacitor (such as a ceramic capacitor) for the output capacitor. The recommended ESR value for an output capacitor is 500mΩ or less (at room temperature).

R1, R2: Output voltage setting resistors

The output voltage can be set by connecting R1 and R2 as shown at left.

The recommended value for R2 is 10kΩ.

$$R1 = (VO - V_{ADJ}) / (V_{ADJ} / R2)$$

C<sub>SS</sub>: Soft start capacitor

The rising time of the output voltage can be set by connecting C<sub>SS</sub> between V<sub>OUT</sub> and ADJ.

Copper Laminate Area (on Glass-Epoxy Board) vs. Thermal Resistance (from Junction to Ambient Temperature) (Typical Value)

- A higher heat radiation effect can be achieved by enlarging the copper laminate area connected to the inner frame to which a monolithic IC is mounted.
- Obtaining the junction temperature  
 Measure GND terminal temperature T<sub>c</sub> with a thermocouple, etc. Then substitute this value in the following formula to obtain the junction temperature.

$$T_j = P_D \times \theta_{j-c} + T_c \quad P_D = (V_{IN} - V_O) \cdot I_{OUT}$$

\*1: 3.3V,5V 3.3 V and 5 V input levels are supported

UVLO ..... Under voltage lockout protection

OCP ..... Over current protection

OCL ..... Overcurrent limiting

TD ..... Thermal detection

TSD ..... Thermal shutdown

FO ..... Fault output

3shunt ..... 3 shunt support

Boot\_Di .... Built-in bootstrap diode

STP ..... Shoot through prevention

Reg ..... Built-in regulator output

\*2: SIM6827M is the low noise version of SIM6822M.

## Application Note

### ■ Setup Precautions

- Recommended mounting torque  
0.588 to 0.784 [N·m](6.0 to 8.0 [kgf·cm])
- Recommended silicone grease  
Shin-Etsu Chemical Co., Ltd.: G746  
Momentive Performance Materials Inc.: YG-6260  
Dow Corning Toray Silicone Co., Ltd.: SC102  
Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

### ■ Handling Precautions

When using the following products that use C-MOS circuits for input terminals, observe the following.

- Carefully control the humidity of the room to prevent the buildup of static electricity. Since static electricity is particularly a problem during the winter, be sure to take sufficient precautions.

Take care to make sure that static electricity is not applied to the IC during wiring and assembly. Take precautions such as shorting the terminals of the printed circuit board to ensure that they are at the same electrical potential.

**■Features**

- Lineup of built-in current sense resistor and built-in protection circuit-type
- Power supply voltages,  $V_{BB}$ : 46 V (max), 10 to 44 V normal operating range
- Logic supply voltages,  $V_{DD}$ : 3.0 to 5.5 V
- Maximum output currents: 1 A, 1.5 A, 2 A, and 3 A
- Built-in sequencer
- Self-excitation PWM current control with fixed off-time
- Synchronous PWM chopping function prevents motor noise in Hold mode
- Sleep mode for reducing the IC input current in stand-by state
- ZIP type 23-pin molded package (SLA package)

## ■ Features

- Built-in power element, normal operation rated output current  $I_{out} = 2A$  (DC)/4A (peak)
- Hall element input
- Provides the following current control functions:
  - Peak current control fixed frequency PWM (internal PWM)
  - PWM control (external PWM) based on speed control signal (analog signal)
  - PWM control (logic PWM) based on logic input
- Protection functions
  - Overcurrent protection, overvoltage protection
  - Thermal protection, undervoltage lockout protection
  - Motor lock detection
- Provides alarm output pin for protection function operation
- Provides pin (FG) to output rotation signal generated by state transition of Hall input
- Built-in synchronous rectifier function that reduces power dissipation
- Built-in switching function for synchronous rectifier operation (Active/Passive)
- Standby mode

## Control IC

### Features

- Drives 6-element N-channel MOSFET
- Supports Hall element input
- Provides the following current control functions:
  - Peak current control fixed frequency PWM (internal PWM)
  - PWM control (logic PWM) based on logic input
- Protection functions
  - Overcurrent protection, overvoltage protection
  - Thermal protection, undervoltage lockout protection
  - Motor lock detection
- Provides alarm output pin for protection function operation
- Provides pin (FG) to output rotation signal generated by state transition of Hall input
- Built-in synchronous rectifier function that reduces power dissipation
- Built-in switching function for synchronous rectifier operation (Active/Passive)
- Standby mode

# SX6800MH Series Surface-Mount, Built-in Overcurrent Protection, Thermal Shutdown, and Overcurrent Limiting Circuits

## Features

- A package of 6 MOSFET units for 3-phase bridge and pre-drive (HVIC, LVIC)
- Best for driving the fan motor (built-in motor) of air conditioner, etc.
- Built-in boot diode with limited resistance
- Built-in undervoltage lock out (UVLO) circuit
- Built-in overcurrent protection circuit (OCP)
- Built-in Thermal Shut Down (TSD) function
- Built-in current limiter function (OCL)
- Error (FO) terminal with shutdown input function
- 7.5V regulator output function (35mA max.)

# SMA6820MH Series Built-in Thermal detection and 7.5 V Regulator

## Features

- A package of 6 MOSFET units for 3-phase bridge, pre-drive (HVIC, LVIC) and boot diode
- Best for fan motor inverter control
- High side drive of bootstrap method has been employed.
- Built-in undervoltage lock out (auto regression)
- Built-in Thermal detection circuit (no stopping)
- Built-in fail signal output function (for when the overheat detection circuit and UVLO)
- Built-in 7.5 V regulator output (35 mA, max.)
- Supports CMOS (3.3 and 5.0 V) input levels

Internal Block Diagram

Typical Connection Diagram

The input pull-down resistor is built into an IC (about 100 kΩ). If the input is expected to be unstable or fluctuate widely, however, it needs to be reinforced with an external resistor.

Attach capacitors near IC. Attach a ceramic capacitor in parallel with the electrolytic capacitor if too much noise is generated.

**SIM6800M Series** Overcurrent Protection, Thermal Shutdown, Built-in Current Limiting Function, 3 Shunt Support, DIP Package

**Features**

- Ideal for driving refrigerator compressors and the fan motor (built-in motor) of air conditioners
- Six MOSFETs for 3-phase bridge and pre-drive circuits (HVIC, LVIC) incorporated in single package  
(For SIM6822M and SIM68227M, the 6 MOSFETs are replaced by 6 IGBTs and 6 FRDs)
- New package (DIP-40) that separates control signal pins and high voltage pins
- 3-shunt configuration allows configuration of vector control
- Built-in boot diode with limiting resistor
- Built-in undervoltage lockout (UVLO) circuit
- Built-in overcurrent protection circuit (OCP)
- Built-in thermal shutdown (TSD) function
- Built-in current limiter function (OCL)
- Error (FO) pin with shutdown input function

# SCM1240M Series IGBT Output Element, Built-in Thermal Shutdown, Overcurrent Protection, and Shoot Through Prevention Circuits

## Features

- Six IGBTs and six FRDs for the 3-phase bridge, a pre-drive IC, and a boot diode are integrated into a single package (For SCM1248M, the 6 IGBTs and 6 FRDs are replaced with 6 MOSFETs)
- Best for driving air conditioner compressors, washing machine drums, and refrigerator compressors
- Built-in shoot through prevention (STP) circuit (when the ON signal is input simultaneously)
- All IGBTs can be shut down when commonly connected to the FO pin.
- Three built-in boot diodes with limiting resistors
- Built-in undervoltage lock out (UVLO) circuit
- Built-in overcurrent protection (OCP) circuit
- Built-in thermal shut down (TSD) circuit
- Fail signal output during operation of the UVLO (low side only), OCP, or STP circuit
- Supports CMOS (3.3 and 5 V) input levels

## ■Features

- Buck converter operations
- High breakdown voltage supply input: 250V (MAX), 450V (MAX)
- Built-in constant current control circuit  
Built-in PWM type constant current control circuit  
Output current can be controlled by REF pin input voltage
- Supports external PWM signal  
Inputting PWM signal to PWM pin enables dimming control  
Inputting Low signal to PWM pin enables turning off of all LED loads
- Protection functions  
Undervoltage lockout function (UVLO)  
Overcurrent protection function (OCP)...Latch shutdown  
Thermal shutdown function (TSD)...Auto restart

## ■Applications

- LED light bulbs

Pin Functions

Symbol	Pin No.		Function
	LC52xxD (DIP8)	LC52xxS (SOP8)	
REG	1	1	Output of the built-in regulator. Supplies current to the internal and external circuits. Connect a 0.1μF bypass capacitor near the pin.
PWM	2	2	Connect CR for OFF time setting when using the internal PWM method. Functions as the input pin for PWM signals when using the external PWM method.
REF	3	3	OUT pin (output MOSFET) for the internal PWM method Input pin for peak current setting Set a peak current based on the REF pin voltage.
SEN	4	4	Pin for detecting output current Connect the current detection resistor RS. Used for peak current detection and overcurrent detection when using the internal PWM method.
OUT	5	5,6	Pin connected to the load. Connected to the drain pin of the built-in MOSFET.
VBB	6	7	Main power input pin. Internal power is supplied from this pin via the internal regulator.
-	7	-	Pin removed LC52xxD (DIP8) has been removed to secure the insulating distance of the high voltage pins. For LC52xxS (SOP8), the design criteria of the customer must be considered.
GND	8	8	GND pin

## ■ Features

- Buck and buck-boost converter operations
- Built-in reference voltage for current setting  
Realizes high precision and easy current setting
- SLEEP function  
Output is latched to off when REF pin input voltage  $\geq V_{SLP}$
- ENABLE function  
All LED loads can be turned off by reducing REF pin input voltage
- High breakdown voltage supply input: 250V (MAX), 450V (MAX)
- Built-in constant current control circuit  
Built-in PWM type constant current control circuit  
Output current can be controlled by REF pin input voltage
- Supports external PWM dimming
- Protection functions  
Flywheel diode open protection (OPP)

Pin Functions

Symbol	Pin No.		Function
	LC522xD (DIP8)	LC522xS (SOP8)	
REG	1	1	Output of the built-in regulator. Supplies current to the internal and external circuits. Connect a 0.1μF bypass capacitor near the pin.
PWM	2	2	Connect CR for OFF time setting when using the internal PWM method. Functions as the input pin for PWM signals when using the external PWM method.
REF	3	3	Input pin for OUT pin (output MOSFET) peak current setting when using the internal PWM method. Set a peak current based on the REF pin voltage. Also, signal input pin for turning the OUT pin (ENABLE function) on and off, and latching the OUT pin to off (SLEEP function).
SEN	4	4	Pin for detecting output current. For internal PWM, connect a detection resistor. Used as a peak current detection and overcurrent detection pin.
OUT	5	5,6	Pin connected to the load. Connected to the drain pin of the built-in output MOSFET.
VBB	6	7	Main power input pin. Internal power is supplied from this pin via the internal regulator.
-	7	-	Pin removed. LC52xD (DIP8) has been removed to secure the insulating distance of the high voltage pins. For LC52xS (SOP8), the design criteria of the customer must be considered.
GND	8	8	GND pin

## Features

- Buck converter operations
- Supports PWM type and Quasi-resonant type control
- Built-in ON time control circuit  
(Average current control enables high power factor)
- Built-in soft start function  
(Reduces load on power MOSFET and secondary side rectifier diodes at power-on)
- Built-in bias assist function  
(Improves startup, suppresses VCC voltage drop during operation, lowers capacitance of VCC capacitor, and enables backup of the control circuit supply by using a ceramic capacitor)
- Built-in leading edge blanking function
- Built-in maximum ON time control circuit
- Protection function  
Overcurrent protection (OCP)...Pulse by pulse  
Overvoltage protection (OVP)...Latch shutdown  
Overload protection (OLP)...Latch shutdown  
Thermal shutdown (TSD)...Latch shutdown

For the polarity of current values, the sink is defined as "positive" and the source is defined as "negative" with respect to the IC.

\*1: The relationship V<sub>CC(BIAS) 1</sub> > V<sub>CC(OFF)</sub> holds true for all products.

\*2: Thermal resistance between the MOSFET channel and the case. The case temperature T<sub>c</sub> is determined by the temperature at the center of the marking surface.

# LC5540 Series LED Driver ICs with Harmonics Standard (ICE61000-3-2 Class C) at all load conditon

## ■Features

- Isolated type
- Built-in ON time control circuit (Average current control enables high power factor)
- Built-in soft start function (Reduces load on power MOSFET and secondary side rectifier diodes at power-on)
- Built-in bias assist function (Improves startup, suppresses VCC voltage drop during operation, lowers capacitance of VCC capacitor, and enables backup of the control circuit supply by using a ceramic capacitor)
- Built-in leading edge blanking function
- Built-in maximum ON time control circuit
- Avalanche energy capacity guaranteed (Enables simplification of the surge absorption circuit.)
- Protection function  
Overcurrent protection (OCP)...Pulse by pulse  
Overvoltage protection (OVP)...Latch shutdown  
Overload protection (OLP)...Latch shutdown  
Thermal shutdown (TSD)...Latch shutdown

## ■Applications

- LED light bulbs
- LED lighting equipment

# LC5720S Series Current Mode PWM Control LED Lighting IC

## ■ Features

- HSOP8 package
- Input voltage range (VIN): 8.5 to 50V
- High efficiency of at least 90%
- Current mode PWM control
- Buck, Boost, Buck-Boost operations
- PWM dimming
- Output current: 2A
- Oscillation frequency: 500kHz
- Protection functions
  - Overcurrent protection (OCP)
  - Overvoltage protection (OVP)
  - Thermal shutdown (TSD)

## ■ Applications

- DC input LED lighting
- Indoor/outdoor LED lighting
- LED spotlights
- RGB LED lighting

# Application Note

Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

## ■ Cautions for Storage

- Ensure that storage conditions comply with the normal temperature (5 to 35°C) and the normal relative humidity (around 40 to 75%), and avoid storage locations that experience high temperature and humidity, or extreme changes in temperature or humidity.
- Avoid locations where dust or harmful gases are present, and avoid direct sunlight.
- Reinspect the devices for rust in leads and solderability after stored for a long time.

## ■ Cautions for Characteristic Tests and Handling

On characteristics test at incoming inspection, etc, take good care to avoid the surge voltages from the test equipment, the short circuit at terminals, or the wrong connection.

## ■ Silicone Grease

When using a heatsink, please coat thinly and evenly the back surface of the device and both surfaces of the insulating plate with silicone grease to lower the thermal resistance between the device and the heatsink. Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

Recommended Silicone Grease

- G-746 (Shin-Etsu Chemical)
- YG6260 (Momentive Performance Materials Inc.)
- SC102 (Dow Corning Toray Silicone)

## ■ Mounting Torque

When mounting torque is insufficient, thermal resistance increases, and so heat radiation effect is decreased. When the torque is excessive, the screw may be broken, the heatsink may be deformed, and the device frame may be distorted, resulting in the device damage. Recommended mounting torque per package is as follows:

### ● Mounting Torque Table

Package	Screw Torque
TO-220	0.490 to 0.686 N·m (5 to 7kgf·cm)
TO-220F (FM20)	
TO-3P (MT-100)	0.686 to 0.882 N·m (7 to 9kgf·cm)
TO-3PF(FM100)	
MT-200 (fixed at two points)	
SIP with Fin (SLA)	0.588 to 0.784 N·m (6 to 8kgf·cm)

\* When the surface of a heatsink where Full Mold package is to be mounted is not flat due to the burred metal bracket for screwing around the mounting hole of the heatsink, the resin of the package might be cracked even if the torque is lower than the recommended value.

\* When a screw is fastened with an air driver for the Full Mold package, a large impact is generated at the time of stop, and the resin may crack even if the torque is lower than the recommended value. An electric driver, therefore, should be used instead of an air driver.

## ■ Heatsink

A larger contact area between the device and the heatsink is required for more effective heat radiation. To ensure a larger contact area, minimize mounting holes. And select a heatsink with a surface smooth enough and free from burrs and slivers.

## ■ Soldering Temperature

In general, the device mounted on a printed circuit board is subjected to high temperatures from flow solder in a solder bath, or, from a soldering iron at hand soldering.

The testing method and test conditions for a device's heat resistance to soldering are:

At a distance of 1.5mm from the device's main body, apply 260°C for 10 seconds, and 350°C for 3 seconds.

Please observe these limits and finish soldering in as short a time as possible.

## ■ Antistatic Measure for Power MOS FET Arrays

- When handling the device, body grounding is necessary. Wear a wrist strap with a 1 MΩ resistor close to the body in the wrist strap to prevent electric shock.
- Use a conductive tablemat and a floor mat at the device-handling workbench and ground them properly.
- When using a curve tracer or other measuring equipment, ground them as well.
- In soldering, ground the soldering iron tip and the solder bath to prevent a leakage voltage from damaging the device.
- As an antistatic measure for device containers, use Sanken shipping containers or a conductive containers, or use aluminum foils. Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

## Application Note

Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

### ■ Cautions for Storage

- Ensure that storage conditions comply with the normal temperature (5 to 35°C) and the normal relative humidity (around 40 to 75%), and avoid storage locations that experience high temperature and humidity, or extreme changes in temperature or humidity.
- Avoid locations where dust or harmful gases are present, and avoid direct sunlight.
- Reinspect the devices for rust in leads and solderability after stored for a long time.

### ■ Cautions for Characteristic Tests and Handling

On characteristics test at incoming inspection, etc, take good care to avoid the surge voltages from the test equipment, the short circuit at terminals, or the wrong connection.

### ■ Silicone Grease

When using a heatsink, please coat thinly and evenly the back surface of the device and both surfaces of the insulating plate with silicone grease to lower the thermal resistance between the device and the heatsink.

Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

Recommended Silicone Grease

- G-746 (Shin-Etsu Chemical)
- YG6260 (Momentive Performance Materials Inc.)
- SC102 (Dow Corning Toray Silicone)

### ■ Mounting Torque

When mounting torque is insufficient, thermal resistance increases, and so heat radiation effect is decreased. When the torque is excessive, the screw may be broken, the heatsink may be deformed, and the device frame may be distorted, resulting in the device damage. Recommended mounting torque per package is as follows:

#### ● Mounting Torque Table

Package	Screw Torque
TO220	0.490 to 0.686 N·m (5 to 7kgf·cm)
TO220F-A, TO220F (FM20)	
TO3P (MT100)	
TO3PF (FM100)	0.686 to 0.882 N·m (7 to 9kgf·cm)

- \* When the surface of a heatsink where Full Mold package is to be mounted is not flat due to the burred metal bracket for screwing around the mounting hole of the heatsink, the resin of the package might be cracked even if the torque is lower than the recommended value.
- \* When a screw is fastened with an air driver for the Full Mold package, a large impact is generated at the time of stop, and the resin may crack even if the torque is lower than the recommended value. An electric driver, therefore, should be used instead of an air driver.

### ■ Heatsink

A larger contact area between the device and the heatsink is required for more effective heat radiation. To ensure a larger contact area, minimize mounting holes. And select a heatsink with a surface smooth enough and free from burrs and slivers.

### ■ Soldering Temperature

In general, the device mounted on a printed circuit board is subjected to high temperatures from flow solder in a solder bath, or, from a soldering iron at hand soldering.

The testing method and test conditions for a device's heat resistance to soldering are:

At a distance of 1.5mm from the device's main body, apply 260°C for 10 seconds, and 350°C for 3 seconds.

Please observe these limits and finish soldering in as short a time as possible.

Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

# Application Note

## General Description

### (1) Lead Forming

When forming leads, hold the lead wire on the main body's side so as to prevent stress from being applied to the main body.

### (2) Mounting

To mount a frame-type diode on a heatsink, use its screw hole. Do not fix its resin body as the silicon chip may get broken.

### (3) Temperature Measurement

For an axial type diode, measure the temperature of the lead wire on the main body side. The thermocouple to be used must be as thin as possible (approximately  $\phi 0.125\text{mm}$ ).

### (4) Temperature Rise Consideration

A diode's temperature increases due to losses from forward current, reverse current and reverse recovery time. In normal use, losses are mainly attributable to forward current and voltage. However, in high frequency circuits such as switching power supplies, losses due to reverse recovery time also occurs. Moreover, in diodes having large reverse currents like Schottky barrier diode losses due to reverse current cannot be disregarded. Forward loss tends to decrease at high temperatures. However, reverse loss tends to increase at high temperatures. Therefore, it is necessary to consider the ambient temperature when verifying operation.

### (5) Inrush Current

In a capacitor-input type rectifier circuit, inrush current flows when the power supply is switched on. The peak value of this inrush current shall be set less than peak forward surge current  $I_{FSM}$  ( $I^2t$  can also be obtained but set the minimum pulse width to 1 msec). The value of  $I_{FSM}$  is guaranteed for a single shot only. If the inrush current is repeated within a short period of time, the derating has to be taken into account.

### (6) Peak Value Current

Considering normal use, limit of the peak value current must be set to 10 times of the average current  $I_F$  (AV). If the peak value increases, the diode's forward loss also increases. In this case, check the temperature rise.

- Carefully study the mounting method when the usage environment is prone to creeping discharge.

## Surface-Mount Diodes

(Part Number Type: SJP)

### Soldering (common to flow and reflow)

- Use rosin based flux. Never use acidic fluxes.
- To prevent a large thermal stress, preheat within 1 to 2 minutes at  $150^\circ\text{C}$  and solder within the usable range shown below.

- For using a soldering iron, use the following references:

Temperature of soldering iron tip:

Lower than  $300^\circ\text{C}$   
(Power of the soldering iron: 30W or lower)  
The soldering tip must be as thin as possible.

Soldering time: Less than 10 seconds

# Marking Guide

## 1 Axial (A0)

- ① Part Number (abbreviation)  
The AM01 is indicated as "M."
- ② Class  
Z: 200V None: 400V A: 600V  
B: 800V C: 1000V
- ③ Manufacturing date  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, D)
- ④ Cathode band: Continuous band  
Color of the band: White (Yellow for AU02 series)

## 2 Axial (E0, E1)

- ① Part Number (abbreviation)  
EM01, EM2, EM1 are indicated as MO, M2 and M1, respectively.
- ② Class  
Z: 200V None: 400V A: 600V  
B: 800V C: 1000V F: 1500V  
But EU02A is indicated as A2 and EU2YX as Y.
- ③ Manufacturing date  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, D)
- ④ Manufacturing period  
• First 10 days of month  
•• Middle 10 days of month  
••• Last 10 days of month

## 3 Axial (R1, R2, R3, R4)

- ① Part Number: 2 set marking
- ② Manufacturing date and period: 2 set marking  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, D)  
• First 10 days of month  
•• Middle 10 days of month  
••• Last 10 days of month
- ③ Cathode band  
Color of the band: 

White:	For Power Supply and SBD
Yellow:	For Medium speed
Red:	For Fast and ultrafast

## 4 TO-220F type

- ① Part Number  
FMU-12S is indicated as "FMU12S."
- ② Polarity: Rectifier Symbol
- ③ Lot No.  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, D)  
Third and fourth letters: Day  
Laser marking or White ink marking

- ① Part Number: Excluding last letter  
FML-G12S is indicated as "FML-G12."
- ② Last letter of Part Number
- ③ Polarity: Rectifier Symbol
- ④ Lot No.  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, D)  
Third and fourth letters: Day  
Laser marking or White ink marking

## 5 TO-3PF, FM100 type

- ① Part Number: Full name
- ② Polarity: Rectifier Symbol
- ③ Lot No.  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, D)  
Third and fourth letters: Day  
Laser marking or White ink marking

## 6 Surface-Mount (SJP)

- ① Part Number
- ② Polarity: Rectifier Symbol
- ③ Lot No.  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, and D)  
Third and fourth letters: Day

## 7 Surface-Mount (TO-220S)

- ① Part Number
- ② Polarity: Rectifier Symbol
- ③ Lot No.  
First letter: Year (Last digit of year)  
Second letter: Month (A to M except I)  
Third letter: Week

## 8 SZ-10 Series

- ① Part Number
- ② Lot No.  
First letter: Year (Last digit of year)  
Second letter: Month (1 to 9, O, N, and D)  
Third letter: Day

# Application Note

## <Mold Type>

### ■ Heat Dissipation and Reliability

Generally, the service life of electronic parts becomes shorter as the temperature increases. Electronic parts can be used without fins, depending on the input and output conditions, but suppressing increases in temperature is the most effective way to enable longer use. The package temperature can be reduced by derating the output current. To get the desired expected service life, implement cooling techniques such as attaching heatsinks or carrying out forced air cooling by using fans. Pay attention to heat dissipation. When mounting the module power supply on the heatsink, make sure to apply silicone grease and attach it securely. Allow sufficient margins in heatsink design. To thoroughly dissipate the heat, consider implementing air convection.

The reliability of input/output capacitors is related to temperature. A high operating temperature may reduce the service life. Only use the capacitors in applications recommended by the capacitor manufacturer.

### ■ Internal Power Dissipation

$P_D$  can be obtained from the following formula.

$$P_D = P_{in} - P_o \\ = V_{in} \times I_{in} - V_o \times I_o$$

Or, if Efficiency  $\eta$  is known,

$$P_D = P_o \times (\frac{1}{\eta} - 1) - P_o$$

$P_D$  : Internal power dissipation  
 $P_{in}$  : Input power  
 $P_o$  : Output power  
 $V_{in}$  : Input voltage  
 $I_{in}$  : Input current  
 $V_o$  : Output voltage  
 $I_o$  : Output current  
 $\eta$  : Efficiency

### ■ Thermal Design

The maximum junction temperature  $T_{j(max)}$  given in the Absolute Maximum Ratings is specific to each product type and must be strictly observed. Thus, thermal design must consider the maximum power dissipation  $P_{D(max)}$ , which varies according to the conditions of use, and the maximum ambient temperature  $T_{a(max)}$ .

To simplify thermal design,  $T_a$ - $P_D$  characteristic graphs are provided herein. Please observe the following steps for heatsink design:

1. Obtain the maximum ambient temperature  $T_{a(max)}$ .
2. Obtain the maximum power dissipation  $P_{D(max)}$ .
3. Look for the intersection point on the  $T_a$ - $P_D$  characteristic graph and determine the size of the heatsink.

Although the heatsink size is now obtained, in actual applications, derating factor of 10-to-20% is generally used. Moreover, the heat dissipation capacity of a heatsink highly depends on how it is mounted. Thus, it is recommended to measure the heatsink and case temperature in the actual operating environment.

For details, refer to the  $T_a$ - $P_D$  characteristic graphs for each product type.

### ■ Mounting Torque

MPM01/04      0.588 to 0.785[N·m]

### ■ Recommended Silicone Grease

- Shin-Etsu Chemical Co., Ltd.: G746
- Momentive Performance Materials Inc.: YG-6260
- Dow Corning Toray Silicone Co., Ltd.: SC102

Be sure to select proper silicone grease carefully since the oil in some grease products may penetrate the device, resulting in an extremely short device life.

### ■ Other notes

- Devices cannot be operated connected in parallel in order to obtain a larger current.
- Module power supplies cannot be used for current boosting or voltage step-up applications.

# MPM Series Step-down Synchronous Rectifier Type DC/DC Converter Module

## ■Features

- Switch element, coil, control circuit and peripheral components incorporated in single package
- Fewer external parts: Only 3 components required: Cin, Co, and RFB
- Oscillation frequency: 250kHz
- Synchronous rectifier type
- High efficiency: 91% typ (VIN=33V, Vo=12V, Io=3A)
- Built-in H/S (40mΩ typ.), L/S (26mΩ typ.) ON resistance switching MOSFETs
- Full mold, stand-alone, IC type package: SIP9 (resin dimensions 24×23×5.5mm)

## ■Applications

- FA equipment, communication equipment
- Consumer equipment, gaming equipment
- Other

Startup Delay Time	Tstart	-	50	-	ms	VIN=16 to 40V. Time from VIN application to when Vo reaches constant voltage precision

\*5: The electrical characteristics are characteristic values guaranteed when the IC is operated under the measurement conditions shown for each of the items in the table above.

\*6: The efficiency is calculated by Formula 1.

$$\eta (\%) = \frac{V_o \times I_o}{V_{IN} \times I_{in}} \times 100 \dots\dots\dots \text{Formula 1}$$

\*7: The line/load regulations do not include the setting deviation of the output voltage. The output voltage setting deviation is affected by the precision of the external RFB.

\*8: When an output voltage of other than Vo=12V is set, the OCP operation point may fluctuate compared to the point when Vo=12V because the inductance of the built-in coil is constant and the frequency is constant for the specified output voltage.

\*9: Auto restore is used for thermal protection.

# BR300 Series 5V/3.3V 1A Non-Isolated Step-down DC/DC Converter Module

## ■ Features

- Output 5V 1A 5W / 3.3V 1A 3.3W
- External dimensions 14mm×14mm×10mm (W×D×H)
- Weight 1.6g
- All-in-one
- Free design
- High efficiency  
BR300: 91%typ. (Vin=8V, Io=0.6A)  
BR301: 87%typ. (Vin=8V, Io=0.6A)
- Downsizing achieved by using high frequency switching technology
- Protection functions  
Overcurrent Protection  
Thermal protection

## ■ Applications

- FA equipment
- Communication equipment
- Consumer equipment
- Other

## ■ Lineup

Product Name	Vo[V]	Io[A]
BR300	5.0	1.0
BR301	3.3	1.0

## ■ Environmental Conditions

Operating Temperature Range	-20 to 85°C	With derating curve
Operating Humidity Range	10 to 90%	Non condensing
Storage Temperature Range	-25 to 85°C	
Storage Humidity Range	5 to 95%	Non condensing

## ■ Absolute Maximum Ratings

(Ta = 25°C, unless otherwise specified)

Parameter	Pin	Symbol	Ratings	Unit	Remarks
Input Voltage	4-2	V <sub>IN</sub>	-0.3 to +35	V	

## ■ Recommended Operating Conditions

(Ta = 25°C, unless otherwise specified)

Parameter	Pin	Symbol	Ratings		Unit	Remarks
			min.	max.		
Input Voltage Range	4-2	V <sub>IN</sub>	8	30	V	
Output Current Range	1-2	I <sub>o</sub>	0	1	A	

## ■ Electrical Characteristics

(Ta = 25°C, unless otherwise specified)

Parameter	Pin	Symbol	Ratings						Unit	Remarks
			BR300			BR301				
			min.	typ.	max.	min.	typ.	max.		
Input Current	4-2	I <sub>IN</sub>	-	0.24	-	-	0.17	-	A	V <sub>IN</sub> =24V, I <sub>o</sub> =1A
Standby Power	4-2	P <sub>STB</sub>	-	0.16	-	-	0.13	-	W	V <sub>IN</sub> =24V, I <sub>o</sub> =0A
Output Voltage	1-2	V <sub>O</sub>	-	5.0	-	-	3.3	-	V	
Constant Voltage Precision	1-2	V <sub>ACC</sub>	-3	-	3	-3	-	3	%	
Output Current	1-2	I <sub>o</sub>	0	-	1	0	-	1	A	
Maximum Output Power	1-2	P <sub>O(MAX)</sub>	-	-	5	-	-	3.3	W	
Output Ripple	1-2	V <sub>RIP</sub>	-	50	-	-	50	-	mV <sub>P-P</sub>	V <sub>IN</sub> =24V, I <sub>o</sub> =1A
Output Noise	1-2	V <sub>NOISE</sub>	-	50	-	-	50	-	mV <sub>P-P</sub>	V <sub>IN</sub> =24V, I <sub>o</sub> =1A
Output Overcurrent Protection	1-2	I <sub>OCP</sub>	1.1	-	-	1.1	-	-	A
