

THE DATASHEET OF ADM213ARZ

ADM206/ADM207/ADM208/ADM211/ADM213

FEATURES

- 0.1 μ F to 10 μ F capacitors
- 120 kB/s data rate
- Two receivers active in shutdown (ADM213)
- On-board dc-to-dc converters
- ± 9 V output swing with 5 V supply
- Low power (15 mW)
- Low power shutdown $\leq 5 \mu$ W
- ± 30 V receiver input levels
- Latch-up free
- Pin compatible to MAX206-211/213

APPLICATIONS

- Computers
- Peripherals
- Modems
- Printers
- Instruments

TYPICAL OPERATING CIRCUIT

- NOTES
¹INTERNAL 400k Ω PULL-UP RESISTOR ON EACH TTL/CMOS INPUT.
²INTERNAL 5k Ω PULL-DOWN RESISTOR ON EACH RS-232 INPUT.

Figure 1.

GENERAL DESCRIPTION

The ADM2xx family of line drivers/receivers is intended for all EIA-232-E and V.28 communications interfaces, especially in applications where ± 12 V is not available. The ADM206, ADM211, and ADM213 feature a low power shutdown mode that reduces power dissipation to less than 5 μ W, making them ideally suited for battery-powered equipment. The ADM213 has an active low shutdown and an active high receiver-enable

control. Two receivers of the ADM213 remain active during shutdown. This feature is useful for ring indicator monitoring.

All members of the ADM2xx family include two internal charge pump voltage converters that allow operation from a single 5 V supply. These parts convert the 5 V input power to the ± 10 V required for RS-232 output levels.

Table 1. Selection Table

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 4. Pin Function Descriptions

Mnemonic	Function
V _{CC}	Power Supply Input. 5 V ± 10%.
V+	Internally Generated Positive Supply (10 V nominal).
V-	Internally Generated Negative Supply (-10 V Nominal).
GND	Ground Pin. Must be connected to 0 V.
C1+	External Capacitor (+ terminal) is connected to this pin.
C1-	External Capacitor (- terminal) is connected to this pin.
C2+	External Capacitor (+ terminal) is connected to this pin.
C2-	External Capacitor (- terminal) is connected to this pin.
T _{IN}	Transmitter (Driver) Inputs. These inputs accept TTL/CMOS levels. An internal 400 kΩ pull-up resistor to V _{CC} is connected to each input.
T _{OUT}	Transmitter (Driver) Outputs. These are RS-232 levels (typically ± 10 V).
R _{IN}	Receiver Inputs. These inputs accept RS-232 signal levels. An internal 5 kΩ pull-down resistor to GND is connected to each input.
R _{OUT}	Receiver Outputs. These are TTL/CMOS levels.
EN/ $\overline{\text{EN}}$	Enable Input. Active low on ADM206 and ADM211. Active high on ADM213. This input is used to enable/disable the receiver outputs. With EN = low (EN = high ADM213), the receiver outputs are enabled. With $\overline{\text{EN}}$ = high (EN = low ADM213), the outputs are placed in a high impedance state. This is useful for connecting to microprocessor systems.
SD/ $\overline{\text{SD}}$	Shutdown Input. Active high on ADM206 and ADM211. Active low on ADM213. With SD = high on the ADM206 and ADM211, the charge pump is disabled, the receiver outputs are placed in a high impedance state, and the driver outputs are turned off. With $\overline{\text{SD}}$ = low on the ADM213, the charge pump is disabled, the driver outputs are turned off, and all receivers, except R4 and R5, are placed in a high impedance state. In shutdown, the power consumption reduces to 5 μW.
NC	No Connect. No connections are required to this pin.

GENERAL INFORMATION

The ADM2xx family of RS-232 drivers/ receivers is designed to solve interface problems by meeting the EIA-232-E specifications while using a single digital 5 V supply. The EIA-232-E standard requires transmitters that will deliver ± 5 V minimum on the transmission channel and receivers that can accept signal levels down to ± 3 V. The ADM2xx meet these requirements by integrating step-up voltage converters and level shifting transmitters and receivers onto the same chip. CMOS technology is used to keep the power dissipation to an absolute minimum. A comprehensive range of transmitter/ receiver combinations is available to cover most communication needs. The ADM2xx are modifications, enhancements, and improvements to the AD2xx family and derivatives thereof. They are essentially plug-in compatible and do not have materially different applications.

The ADM206, ADM211, and ADM213 are particularly useful in battery-powered systems because they feature a low power shut-down mode that reduces power dissipation to less than 5 μ W.

To facilitate sharing a common line or for connection to a microprocessor data bus, the ADM206, the ADM211, and the ADM213 feature an enable ($\overline{\text{EN}}$) function. When the receivers are disabled, their outputs are placed in a high impedance state.

CIRCUIT DESCRIPTION

The internal circuitry in the ADM2xx consists of three main sections: (a) a charge pump voltage converter; (b) RS-232-to-TTL/CMOS receivers; and (c) TTL/CMOS-to-RS-232 transmitters.

Charge Pump DC-to-DC Voltage Converter

The charge pump voltage converter consists of an oscillator and a switching matrix. The converter generates a ± 10 V supply from the 5 V input. This is done in two stages using a switched capacitor technique, as illustrated in Figure 20 and Figure 21. First, the 5 V input supply is doubled to 10 V using capacitor C1 as the charge storage element. The 10 V level is then inverted to generate -10 V using C2 as the storage element.

Figure 20. Charge Pump Voltage Doubler

Figure 21. Charge Pump Voltage Inverter

Capacitors C3 and C4 are used to reduce the output ripple. Their values are not critical and can be reduced if higher levels of ripple are acceptable. The charge pump capacitors C1 and C2 may also be reduced at the expense of higher output impedance on the V+ and V- supplies.

The V+ and V- supplies may also be used to power external circuitry if the current requirements are small.

Transmitters (Drivers)

The drivers convert TTL/CMOS input levels into EIA-232-E output levels. With $V_{CC} = +5$ V and driving a typical EIA-232-E load, the output voltage swing is ± 9 V. Even under worst-case conditions, the drivers are guaranteed to meet the ± 5 V EIA-232-E minimum requirement.

The input threshold levels are both TTL- and CMOS-compatible with the switching threshold set at $V_{CC}/4$. With a nominal $V_{CC} = 5$ V, the switching threshold is 1.25 V typical. Unused inputs may be left unconnected, because an internal 400 k Ω pull-up resistor pulls them high, forcing the outputs into a low state.

As required by the EIA-232-E standard, the slew rate is limited to less than 30 V/ μ s, without the need for an external slew limiting capacitor, and the output impedance in the power-off state is greater than 300 Ω .

Receivers

The receivers are inverting level shifters that accept EIA-232-E input levels (± 5 V to ± 15 V) and translate them into 5 V TTL/CMOS levels. The inputs have internal 5 k Ω pull-down resistors to ground and are also protected against overvoltages of up to ± 30 V. The guaranteed switching thresholds are 0.8 V minimum and 2.4 V maximum, well within the ± 3 V EIA-232-E requirement. The low level threshold is deliberately positive, since it ensures that an unconnected input will be interpreted as a low level.

The receivers have Schmitt-trigger inputs with a hysteresis level of 0.65 V. This ensures error-free reception for both noisy inputs and inputs with slow transition times.

ADM206/ADM207/ADM208/ADM211/ADM213

Shutdown (SD)

The ADM2xx feature a control input that may be used to disable the part and reduce the power consumption to less than 5 Ω W. This is very useful in battery-operated systems. During shutdown, the charge pump is turned off, the transmitters are disabled, and all receivers except R4 and R5 on the ADM213 are put into a high impedance disabled state. Receivers R4 and R5 on the ADM213 remain enabled during shutdown. This feature allows monitoring external activity while the device is in a low power shutdown mode. The shutdown control input is active high on all parts except the ADM213, where it is active low. See Table 5 and Table 6.

Enable Input

The ADM211 and ADM213 feature an enable input used to enable or disable the receiver outputs. The enable input is active low on the ADM211 and active high on the ADM213. See Table 5 and Table 6. When the receivers are disabled, their outputs are placed in a high impedance state. This function allows the outputs to be connected directly to a microprocessor data bus. It can also be used to allow receivers from different devices to share a common data line. The timing diagram for the enable function is shown in Figure 22.

Figure 22. Enable Timing

APPLICATION HINTS

Driving Long Cables

In accordance with the EIA-232-E standard, long cables are permissible provided the total load capacitance does not exceed 2500 pF. For longer cables that do exceed this, it is possible to trade off baud rate for cable length. Large load capacitances cause a reduction in slew rate, and therefore the maximum transmission baud rate is decreased. The ADM2xx are designed to minimize the slew rate reduction that occurs as load capacitance increases.

For the receivers, it is important that a high level of noise immunity be inbuilt so that slow rise and fall times do not cause multiple output transitions as the signal passes slowly through the transition region. The ADM2xx have 0.65 V of hysteresis to guard against this. This ensures that even in noisy environments error-free reception can be achieved.

High Baud Rate Operation

The ADM2xx feature high slew rates, permitting data transmission at rates well in excess of the EIA-232-E specification. The drivers maintain ± 5 V signal levels at data rates up to 120 kB/s under worst-case loading conditions.
