

**THE DATASHEET OF
AD706JRZ-REEL**

FEATURES

- High DC Precision
- 100 μV Max Offset Voltage
- 1.5 $\mu\text{V}/^\circ\text{C}$ Max Offset Drift
- 200 pA Max Input Bias Current
- 0.5 μV p-p Voltage Noise, 0.1 Hz to 10 Hz
- 750 μA Supply Current
- Available in 8-Lead PDIP and Surface-Mount (SOIC) Packages
- Available in Tape and Reel in Accordance with EIA-481A Standard
- Quad Version: AD704

APPLICATIONS

- Low Frequency Active Filters
- Precision Instrumentation
- Precision Integrators

GENERAL DESCRIPTION

The AD706 is a dual, low power, bipolar op amp that has the low input bias current of a JFET amplifier, but which offers a significantly lower I_B drift over temperature. It utilizes superbeta bipolar input transistors to achieve picoampere input bias current levels (similar to FET input amplifiers at room temperature), while its I_B typically only increases by $5\times$ at 125°C (unlike a JFET amp, for which I_B doubles every 10°C for a $1000\times$ increase at 125°C). The AD706 also achieves the microvolt offset voltage and low noise characteristics of a precision bipolar input amplifier.

Since it has < 200 pA of bias current, the AD706 does not require the commonly used “balancing” resistor. Furthermore, the current noise is only $50 \text{ fA}/\sqrt{\text{Hz}}$, which makes this amplifier usable with very high source impedances. At $600 \mu\text{A}$ max supply current (per amplifier), the AD706 is well suited for today’s high density boards.

The AD706 is an excellent choice for use in low frequency active filters in 12-bit and 14-bit data acquisition systems, in precision instrumentation, and as a high quality integrator. The AD706 is internally compensated for unity gain and is available in five performance grades. The AD706J is rated over the commercial temperature range of 0°C to $+70^\circ\text{C}$. The AD706A is rated for the extended industrial temperature range of -40°C to $+85^\circ\text{C}$.

The AD706 is offered in two varieties of an 8-lead package: PDIP and surface-mount (SOIC).

CONNECTION DIAGRAM

PDIP (N) and Plastic SOIC (R) Packages

PRODUCT HIGHLIGHTS

1. The AD706 is a dual low drift op amp that offers JFET level input bias currents, yet has the low I_B drift of a bipolar amplifier. It may be used in circuits using dual op amps such as the LT1024.
2. The AD706 provides both low drift and high dc precision.
3. The AD706 can be used in applications where a chopper amplifier would normally be required but without the chopper’s inherent noise.

NOTES

¹Bias current specifications are guaranteed maximum at either input.

²Input bias current match is the difference between corresponding inputs (I_B of -IN of Amplifier 1 minus I_B of -IN of Amplifier 2).

CMRR match is the difference between $\frac{\Delta V_{OS1}}{\Delta V_{CM}}$ for Amplifier 1 and $\frac{\Delta V_{OS2}}{\Delta V_{CM}}$ for Amplifier 2, expressed in dB.

PSRR match is the difference between $\frac{\Delta V_{OS1}}{\Delta V_{SUPPLY}}$ for Amplifier 1 and $\frac{\Delta V_{OS2}}{\Delta V_{SUPPLY}}$ for Amplifier 2, expressed in dB.

All min and max specifications are guaranteed.
Specifications subject to change without notice.

ABSOLUTE MAXIMUM RATINGS¹

- Supply Voltage ±18 V
- Internal Power Dissipation
(Total: Both Amplifiers)² 650 mW
- Input Voltage ±V_S
- Differential Input Voltage³ +0.7 V
- Output Short Circuit Duration Indefinite
- Storage Temperature Range (N, R) -65°C to +125°C
- Operating Temperature Range
AD706J 0°C to +70°C
AD706A -40°C to +85°C
- Lead Temperature (Soldering 10 secs) 300°C

NOTES

¹Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

²Specification is for device in free air:

8-Lead PDIP Package: θ_{JA} = 100°C/W

8-Lead Small Outline Package: θ_{JA} = 155°C/W

³The input pins of this amplifier are protected by back-to-back diodes. If the differential voltage exceeds ±0.7 V, external series protection resistors should be added to limit the input current to less than 25 mA.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.
Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

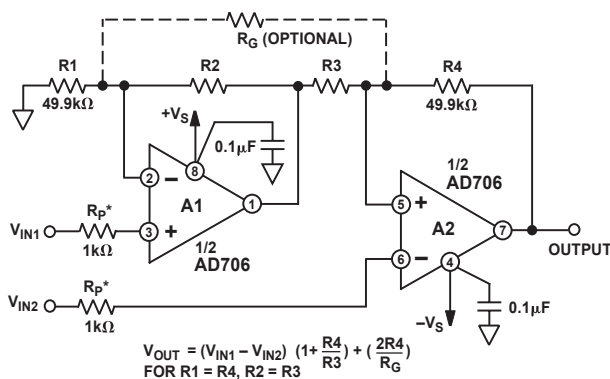

Figure 5d. Unity Gain Inverter Small Signal Pulse Response, $C_L = 1000 \text{ pF}$

Figure 6 shows an in-amp circuit that has the obvious advantage of requiring only one AD706, rather than three op amps, with subsequent savings in cost and power consumption. The transfer function of this circuit (without R_G) is

$$V_{OUT} = (V_{IN1} - V_{IN2}) \left(1 + \frac{R4}{R3} \right)$$

for $R1 = R4$ and $R2 = R3$.

Input resistance is high, thus permitting the signal source to have an unbalanced output impedance.

$$V_{OUT} = (V_{IN1} - V_{IN2}) \left(1 + \frac{R4}{R3} \right) + \left(\frac{2R4}{R_G} \right)$$

FOR $R1 = R4, R2 = R3$

* OPTIONAL INPUT PROTECTION RESISTOR FOR GAINS GREATER THAN 100 OR INPUT VOLTAGES EXCEEDING THE SUPPLY VOLTAGE.

Figure 6. Two Op Amp Instrumentation Amplifier

Furthermore, the circuit gain may be fine trimmed using an optional trim resistor, R_G . Like the three op amp circuit, CMR increases with gain, once initial trimming is accomplished—but

CMR is still dependent upon the ratio matching of Resistors $R1$ through $R4$. Resistor values for this circuit, using the optional gain resistor, R_G , can be calculated using

$$R1 = R4 = 49.9 \text{ k}\Omega$$

$$R2 = R3 = \frac{49.9 \text{ k}\Omega}{0.9G - 1}$$

$$R_G = \frac{99.8 \text{ k}\Omega}{0.06G}$$

where G = The desired circuit gain.

Table I provides practical 1% resistance values. Note that without resistor R_G , $R2$ and $R3 = 49.9 \text{ k}\Omega / G - 1$.

Table I. Operating Gains of Amplifiers A1 and A2 and Practical 1% Resistor Values for the Circuit of Figure 6

Circuit Gain	Gain of A1	Gain of A2	R2, R3	R1, R4
1.10	11.00	1.10	499 kΩ	49.9 kΩ
1.33	4.01	1.33	150 kΩ	49.9 kΩ
1.50	3.00	1.50	100 kΩ	49.9 kΩ

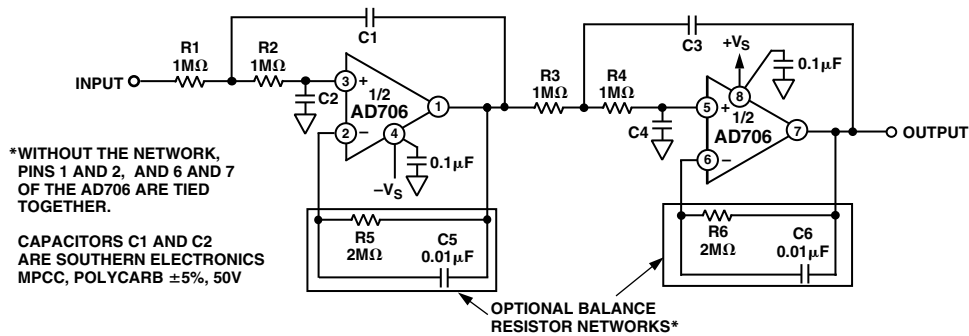

Figure 7. 1 Hz, 4-Pole Active Filter

1 Hz, 4-Pole, Active Filter

Figure 7 shows the AD706 in an active filter application. An important characteristic of the AD706 is that both the input bias current, input offset current, and their drift remain low over most of the op amp's rated temperature range. Therefore, for most applications, there is no need to use the normal balancing resistor. Adding the balancing resistor enhances performance at high temperatures, as shown by Figure 8.

Figure 8. V_{OS} vs. Temperature Performance of the 1 Hz Filter

Table II. 1 Hz, 4-Pole, Low Pass Filter Recommended Component Values

Desired Low Pass Response	Section 1		Section 2		C1 (μF)	C2 (μF)	C3 (μF)	C4 (μF)
	Frequency (Hz)	Q	Frequency (Hz)	Q				
Bessel	1.43	0.522	1.60	0.806	0.116	0.107	0.160	0.0616
Butterworth	1.00	0.541	1.00	1.31	0.172	0.147	0.416	0.0609
0.1 dB Chebychev	0.648	0.619	0.948	2.18	0.304	0.198	0.733	0.0385
0.2 dB Chebychev	0.603	0.646	0.941	2.44	0.341	0.204	0.823	0.0347
0.5 dB Chebychev	0.540	0.705	0.932	2.94	0.416	0.209	1.00	0.0290
1.0 dB Chebychev	0.492	0.785	0.925	3.56	0.508	0.206	1.23	0.0242

NOTE

Specified Values are for a -3 dB point of 1.0 Hz. For other frequencies simply scale capacitors C1 through C4 directly, i.e. for 3 Hz Bessel response, C1 = 0.0387 μF, C2 = 0.0357 μF, C3 = 0.0533 μF, C4 = 0.0205 μF.
