

## SY89296U

2.5V/3.3V 1.5GHz Precision  
LVPECL Programmable Delay  
with Fine Tune Control

Precision Edge<sup>®</sup>

Precision Edge<sup>®</sup>

### General Description

The SY89296U is a programmable delay line that delays the input signal using a digital control signal. The delay can vary from 3.2ns to 14.8ns in 10ps increments. Further, the delay may be varied continuously in about 40ps range by setting the voltage at the FTUNE pin. In addition, the input signal is LVPECL, uses either a 2.5V  $\pm$ 5% or 3.3V  $\pm$ 10% power supply, and is guaranteed over the full industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ).

The delay varies in discrete steps based on a control word. The control word is 10-bits long and controls the delay in 10ps increments. The eleventh bit is D[10] and is used to simultaneously cascade the SY89296U for a larger delay range. In addition, the input pins IN and /IN default to an equivalent low state when left floating. Further, for maximum flexibility, the control register interface accepts CMOS or TTL level signals.

For applications that do not require an analog delay input, see the SY89295U. The SY89295U and SY89296U are part of Micrel's high-speed, Precision Edge<sup>®</sup> product line.

Data sheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

### Features

- Precision LVPECL programmable delay time
- Guaranteed AC performance over temperature and voltage:
  - $>1.5\text{GHz } f_{\text{MAX}}$
  - $<160\text{ps}$  rise/fall times
- Low jitter design:
  - $<10\text{ps}_{\text{PP}}$  total jitter
  - $<2\text{ps}_{\text{RMS}}$  cycle-to-cycle jitter
  - $<1\text{ps}_{\text{RMS}}$  random jitter
- Programmable delay range: 3.2ns to 14.8ns in 10ps increments
- Increased monotonicity over the MC100EP195
- $\pm 10\text{ps}$  INL
- VBB output reference voltage
- Parallel inputs accept LVPECL or CMOS/LVTTL
- 40ps/V fine tune range
- Low voltage operation: 2.5V  $\pm$ 5% and 3.3V  $\pm$ 10%
- Industrial  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  temperature range
- Available in 32-pin (5mm  $\times$  5mm) MLF<sup>®</sup> package or 32-pin TQFP package

### Applications

- Clock de-skewing
- Timing adjustments
- Aperture centering

SY89296UTG <sup>(3)</sup>	T32-1	-40°C to +85°C	SY89296U with Pb-Free bar-line indicator	Pb-Free NiPdAu
SY89296UTGTR <sup>(2, 3)</sup>	T32-1	-40°C to +85°C	SY89296U with Pb-Free bar-line indicator	Pb-Free NiPdAu

**Notes:**

1. Contact factory for die availability. Dice are guaranteed at T<sub>A</sub> = 25°C, DC electricals only.
2. Tape and Reel.
3. Pb-Free package recommended for new designs.

## Pin Configuration

**32-Pin MLF<sup>®</sup> (MLF-32)**

**32-Pin TQFP (T32-1)**

## Pin Description

Pin Number	Pin Name	Pin Function
23, 25, 26, 27, 29, 30, 31, 32, 1, 2	D[9:0]	CMOS, ECL, or TTL Control Bits: These control signals adjust the delay from IN to Q. See “AC Electrical Characteristics” for delay values. In addition, see “Interface Applications” section which illustrates the proper interfacing techniques for different logic standards. D[9:0] contains pull-downs and defaults LOW when left floating. D0 (LSB), and D9 (MSB). See “Typical Operating Characteristics” for delay information.
3	D10	CMOS, ECL, or TTL Control Bit: This bit is used to cascade devices for an extended delay range. In addition, it drives CASCADE and /CASCADE. Further, D[10] contains a pull-down and defaults LOW when left floating.
4, 5	IN, /IN	LVPECL/ECL Signal Input: Input signal to be delayed. IN contains a 75k $\Omega$ pull-down and will default to a logic LOW if left floating.
6	VBB <sup>(1)</sup>	Reference Voltage Output: When using a single-ended input signal source to IN or /IN, connect the unused input of the differential pair to this pin. This pin can also be used to rebias AC-coupled inputs to IN and /IN. When used, de-couple to Vcc using a 0.01 $\mu$ F capacitor, otherwise leave floating if not used. Maximum sink/source is $\pm$ 0.5mA.
7	VEF	Reference Voltage Output: Connect this pin to VCF when D[9:0], and D[10] is ECL.
		<b>Logic Standard</b>
		LVPECL
		<b>Vcf Connects to:</b>
		VEF(1)
		CMOS
		No Connect
		TTL
		1.5V Source
8	VCF	Reference Voltage Input: The voltage driven on VCF sets the logic transition threshold for D[9:0], and D[10].
9, 24, 28	GND, Exposed Pad <sup>(2)</sup>	Negative Supply: For MLF <sup>®</sup> package, exposed pad must be connected to a ground plane that is the same potential as the ground pin.
10	LEN	ECL Control Input: When HIGH latches the D[9:0] and D[10] bits. When LOW, the D[9:0] and D[10] latches are transparent.
11	SETMIN	ECL Control Input: When HIGH, D[9:0] registers are reset. When LOW, the delay is set by SETMAX or D[9:0] and D[10]. SETMIN contains a pull-down and defaults LOW when left floating.
12	SETMAX	ECL Control Input: When SETMAX is set HIGH and SETMIN is set LOW, D[9:0] = 111111111. When SETMAX is LOW, the delay is set by SETMIN or D[9:0] and D[10]. SETMAX contains a pull-down and defaults LOW when left floating.
13, 18, 19, 22	VCC	Positive Power Supply: Bypass with 0.1 $\mu$ F and 0.01 $\mu$ F low ESR capacitors.
14, 15	/Cascade, Cascade	LVPECL Differential Output: The outputs are used when cascading two or more SY89296U to extend the delay range.
16	/EN	LVPECL Single-Ended Control Input: When LOW, Q is delayed from IN. When HIGH, Q is a differential LOW. /EN contains a pull-down and defaults LOW when left floating.
20, 21	/Q, Q	LVPECL Differential Output: Q is a delayed version of IN, Always terminates the output with 50 $\Omega$ to VCC – 2V. See “Output Interface Applications” section.
17	FTUNE	Voltage Control Input: By varying the voltage, the delay is fine tuned, see the graph, “Propagation Delay vs. FTUNE Voltage.” Leave pin floating if not used.

### Notes:

1. Single-ended operation is only functional at 3.3V.
2. MLF<sup>®</sup> package only.

## Truth Tables

### DC Electrical Characteristics<sup>(4)</sup>

$T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ , unless otherwise stated.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
VCC	Power Supply	VCC = 2.5V	2.375	2.5	2.625	V
		VCC = 3.3V	3	3.3	3.6	
IEE	Power Supply Current	No load, max. VCC			220	mA
VIN	Input Voltage Swing (IN, /IN)	See Figure 1a.	150		1200	mV
VDIFF_IN	Differential Input Voltage Swing (IN, /IN)	See Figure 1b.	300		2400	mV
VIHCMR	Input High Common Mode Range	IN, /IN	VEE + 1.2		VCC	V

$V_{CC} = 3.3\text{V}$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ , unless otherwise stated.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
V <sub>IH</sub>	Input High Voltage (IN, /IN)		2.075		2.420	V
V <sub>IL</sub>	Input Low High Voltage (IN, /IN)		1.355		1.675	V
V <sub>BB</sub>	Output Voltage Reference		1.775	1.875	1.975	V
V <sub>EF</sub>	Mode Connection		1.9	2.0	2.1	V
V <sub>CF</sub>	Input Select Voltage		1.55	1.65	1.75	V

**Notes:**

1. Permanent device damage may occur if "Absolute Maximum Ratings" are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to "Absolute Maximum Rating" conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance on MLF<sup>®</sup> packages assumes exposed pad is soldered (or equivalent) to the device most negative potential (GND).
4. The circuit is designed to meet the DC specifications shown in the table above after thermal equilibrium has been established. Input and output parameters vary 1:1 with  $V_{CC}$ , with the exception of  $V^{CF}$ .

## DC Electrical Characteristics<sup>(4)</sup> (Continued)

$V_{CC} = 2.5V$ ,  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ , unless otherwise stated.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{IH}$	Input High Voltage (IN, /IN)		1.275		1.62	V
$V_{IL}$	Input Low High Voltage (IN, /IN)		0.555		0.875	V
$V_{BB}$	Output Voltage Reference		0.925	1.075	1.175	V
$V_{EF}$	Mode Connection		1.10	1.20	1.30	V
$V_{CF}$	Input Select Voltage		1.15	1.25	1.35	V

## LVPECL Outputs DC Electrical Characteristics<sup>(5)</sup>

$V_{CC} = 3.3V$ ,  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ ;  $R_{LOAD} = 500\Omega$  to  $V_{CC} - 2V$ , unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{OH}$	Output HIGH Voltage (Q, /Q)		2.155	2.280	2.405	V
$V_{OL}$	Output LOW Voltage (Q, /Q)		1.355	1.480	1.605	V
$V_{OUT}$	Output Voltage Swing (Q, /Q)	See Figure 1a.	550	800		mV
$V_{DIFF\_OUT}$	Differential Output Voltage Swing (Q, /Q)	See Figure 1b.	1.1	1.6		V

$V_{CC} = 2.5V$ ,  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ ;  $R_{LOAD} = 50\Omega$  to  $V_{CC} - 2V$ , unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{OH}$	Output HIGH Voltage (Q, /Q)		1.355	1.48	1.605	V
$V_{OL}$	Output LOW Voltage (Q, /Q)		0.555	0.680	0.805	V
$V_{OUT}$	Output Voltage Swing (Q, /Q)	See Figure 1a.	550	800		mV
$V_{DIFF\_OUT}$	Differential Output Voltage Swing (Q, /Q)	See Figure 1b.	1.1	1.6		V

## LVTTL/CMOS Outputs DC Electrical Characteristics<sup>(6)</sup>

$V_{CC} = 2.5V \pm 5\%$  or  $3.3V \pm 10\%$ ;  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ ; unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
VCC	Power Supply	$V_{CC} = 2.5V$	2.375	2.5	2.625	V
		$V_{CC} = 3.3V$	3	3.3	3.6	
IEE	Power Supply Current	No load, max. VCC			220	mA
VIN	Input Voltage Swing (IN, /IN)	See Figure 1a.	150		1200	mV
VDIFF_IN	Differential Input Voltage Swing (IN, /IN)	See Figure 1b.	300		2400	mV

### Notes:

- The circuit is designed to meet the DC specifications shown in the table above after thermal equilibrium has been established.  $V_{OH}$  and  $V_{OL}$  parameters vary 1:1 with  $V_{CC}$ .
- The circuit is designed to meet the DC specifications shown in the table above after thermal equilibrium has been established

## AC Electrical Characteristics<sup>(7)</sup>

				1150		
				2300		
				4610		
	9220					
INL	Integral Non-Linearity	<b>Note 9</b>		±10		ps

### Notes:

- High-frequency AC electricals are guaranteed by design and characterization.
- Duty cycle skew guaranteed only for differential operation measured from the crosspoint of the input to the crosspoint of the output.
- INL (Integral Non-Linearity) is defined from its corresponding point on the ideal delay vs. D[9:0] curve as the deviation from its ideal delay. The maximum difference is the INL. Theoretical Ideal Linearity (TIL) = measured maximum delay – measured minimum delay ÷ 1024. INL = measured delay – measured minimum delay + (step number × TIL).

## AC Electrical Characteristics<sup>(7)</sup> (Continued)

T<sub>A</sub> = -40°C to +85°C, unless otherwise stated.

	Total Jitter	<b>Note 14</b>			10	ps <sub>PP</sub>
	Random Jitter	<b>Note 15</b>			1	ps <sub>RMS</sub>
t <sub>r</sub> , t <sub>f</sub>	Output Rise/Fall Time	20% to 80% (Q)	50	85	160	ps
		20% to 80% (CASCADE)	90		300	ps
	Duty Cycle		45		55	%
f <sub>T</sub>	F <sub>TUNE</sub>	0 ≤ F <sub>TUNE</sub> ≤ 1.25V		47	52	Ps/V

### Notes:

- This setup time defines the amount of time prior to the input signal. The delay tap of the device must be set.
- This setup time defines the amount of the time that /EN must be asserted prior to the next transition of IN, /IN to prevent an output response greater than ±75mV to the IN, /IN transition.
- Hold time is the minimum time that /EN must remain asserted after a negative going IN or a positive going /IN to prevent an output response greater than ±75mV to that IN, /IN transition.
- Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles over a random sample of adjacent cycle pairs  
 $T_{\text{jitter\_cc}} = T_n - T_{n-1} + 1$ , where T is the time between rising edges of the output signal.
- Total jitter definition: with an ideal clock input, no more than one output edge in 10<sup>12</sup> output edges will deviate by more than the specified peak-to-peak jitter value.
- Random jitter definition: jitter that is characterized by a Gaussian distribution, unbounded and is quantified by its standard deviation and mean. Random jitter is measured with a K28.7 comma defect pattern, measured at 1.5Gbps.

## Typical Operating Characteristics

$V_{CC} = 3.3V$ ,  $GND = 0$ ,  $D_{IN} = 100mV$ ,  $T_A = 25^{\circ}C$ , unless otherwise noted.

## Application Information

For best performance, use good high frequency layout techniques, filter  $V_{CC}$  supplies, and keep ground connections short. Use multiple vias where possible. Also, use controlled impedance transmission lines to interface with the SY89296U data inputs and outputs.

### $V_{BB}$ Reference

The  $V_{BB}$  pin is an internally generated reference and is available for use only by the SY89296U. When unused, this pin should be left unconnected. The two common uses for  $V_{BB}$  are to handle a single-ended PECL input, and to re-bias inputs for AC-coupling applications.

If either IN or /IN is driven by a single-ended output,  $V_{BB}$  is used to bias the unused input. Please refer to Figure 10. The PECL signal driving the SY89296U may optionally be inverted in this case.

When the signal is AC-coupled,  $V_{BB}$  is used, as shown in Figure 13, to re-bias IN and/or /IN. This ensures that SY89296U inputs are within acceptable common mode range.

In all cases,  $V_{BB}$  current sinking or sourcing must be limited to 0.5mA or less.

### Setting D Input Logic Thresholds

In all designs where the SY89296U GND supply is at zero volts, the D inputs can accommodate CMOS and TTL level signals, as well as PECL or LVPECL. Figures 11, 12, and 14 show how to connect VCF and VEF for all possible cases.

### Cascading

Two or more SY89296U may be cascaded in order to extend the range of delays permitted. Each additional SY89296U adds about 3.2ns to the minimum delay and adds another 10240ps to the delay range.

Internal cascade circuitry has been included in the SY89296U. Using this internal circuitry, the SY89296U may be cascaded without any external gating.

Examples of cascading 2, 3, or 4 SY89296U appear in Figures 7, 8, and 9.

Figure 7. Cascading Two SY89296U

Figure 8. Cascading Three SY89296U
