

**THE DATASHEET OF
ADM2587EBRWZ**

FEATURES

Isolated RS-485/RS-422 transceiver, configurable as half or full duplex
isoPower integrated isolated dc-to-dc converter
 ± 15 kV ESD protection on RS-485 input/output pins
Complies with ANSI/TIA/EIA-485-A-98 and ISO 8482:1987(E)
ADM2582E data rate: 16 Mbps
ADM2587E data rate: 500 kbps
5 V or 3.3 V operation
Connect up to 256 nodes on one bus
Open- and short-circuit, fail-safe receiver inputs
High common-mode transient immunity: >25 kV/ μ s
Thermal shutdown protection
Safety and regulatory approvals
UL recognition: 2500 V rms for 1 minute per UL 1577
VDE Certificates of Conformity
DIN EN 60747-5-2 (VDE 0884 Part 2): 2003-01
 $V_{IORM} = 560$ V peak
Operating temperature range: -40°C to $+85^{\circ}\text{C}$
Highly integrated, 20-lead, wide-body SOIC package

APPLICATIONS

Isolated RS-485/RS-422 interfaces
Industrial field networks
Multipoint data transmission systems

GENERAL DESCRIPTION

The ADM2582E/ADM2587E are fully integrated signal and power isolated data transceivers with ± 15 kV ESD protection and are suitable for high speed communication on multipoint transmission lines. The ADM2582E/ADM2587E include an integrated isolated dc-to-dc power supply, which eliminates the need for an external dc-to-dc isolation block.

They are designed for balanced transmission lines and comply with ANSI/TIA/EIA-485-A-98 and ISO 8482:1987(E).

The devices integrate Analog Devices, Inc., iCoupler® technology to combine a 3-channel isolator, a three-state differential line driver, a differential input receiver, and Analog Devices isoPower® dc-to-dc converter into a single package. The devices are powered by a single 5 V or 3.3 V supply, realizing a fully integrated signal and power isolated RS-485 solution.

FUNCTIONAL BLOCK DIAGRAM

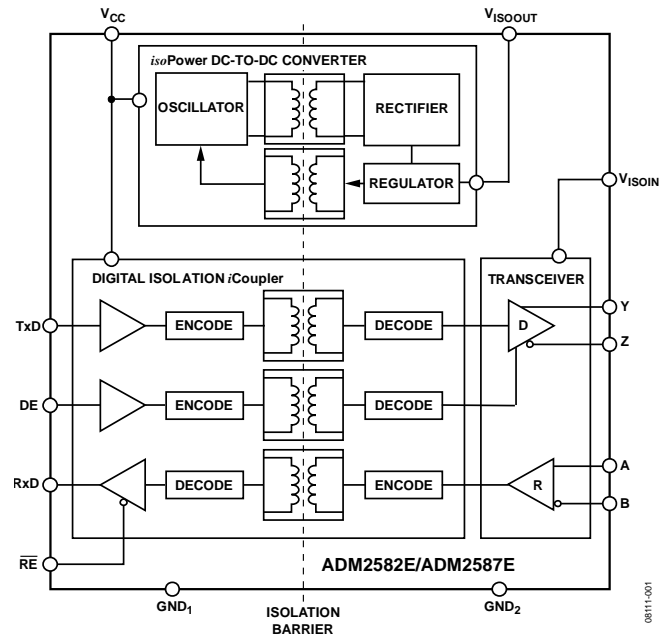

Figure 1.

The ADM2582E/ADM2587E driver has an active high enable. An active low receiver enable is also provided, which causes the receiver output to enter a high impedance state when disabled.

The devices have current limiting and thermal shutdown features to protect against output short circuits and situations where bus contention may cause excessive power dissipation. The parts are fully specified over the industrial temperature range and are available in a highly integrated, 20-lead, wide-body SOIC package.

The ADM2582E/ADM2587E contain isoPower technology that uses high frequency switching elements to transfer power through the transformer. Special care must be taken during printed circuit board (PCB) layout to meet emissions standards. Refer to the AN-0971 Application Note, Control of Radiated Emissions with isoPower Devices, for details on board layout considerations.

SPECIFICATIONS

All voltages are relative to their respective ground; $3.0 \leq V_{CC} \leq 5.5$ V. All minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted. All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{CC} = 5$ V unless otherwise noted.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
ADM2587E SUPPLY CURRENT Data Rate ≤ 500 kbps	I_{CC}		90		mA	$V_{CC} = 3.3$ V, 100 Ω load between Y and Z
			72		mA	$V_{CC} = 5$ V, 100 Ω load between Y and Z
			125		mA	$V_{CC} = 3.3$ V, 54 Ω load between Y and Z
			98		mA	$V_{CC} = 5$ V, 54 Ω load between Y and Z
				120	mA	120 Ω load between Y and Z

Logic Outputs						
Output Voltage Low	V_{OL}		0.2	0.4	V	$I_O = 1.5$ mA, $V_A - V_B = -0.2$ V
Output Voltage High	V_{OH}	$V_{CC} - 0.3$	$V_{CC} - 0.2$		V	$I_O = -1.5$ mA, $V_A - V_B = 0.2$ V
Short-Circuit Current				100	mA	
COMMON-MODE TRANSIENT IMMUNITY ¹		25			kV/ μs	$V_{CM} = 1$ kV, transient magnitude = 800 V

¹ CM is the maximum common-mode voltage slew rate that can be sustained while maintaining specification-compliant operation. V_{CM} is the common-mode potential difference between the logic and bus sides. The transient magnitude is the range over which the common-mode is slewed. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

Output Current		I _{S, OUTPUT}	335	mA
Insulation Resistance at T _S	V _{IO} = 500 V	R _S	>10 ⁹	Ω

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted. All voltages are relative to their respective ground.

Table 8.

Parameter	Rating
V_{CC}	-0.5 V to +7 V
Digital Input Voltage (DE, \overline{RE} , TxD)	-0.5 V to $V_{DD} + 0.5$ V
Digital Output Voltage (Rx/D)	-0.5 V to $V_{DD} + 0.5$ V
Driver Output/Receiver Input Voltage	-9 V to +14 V
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-55°C to +150°C
ESD (Human Body Model) on A, B, Y, and Z pins	± 15 kV
ESD (Human Body Model) on Other Pins	± 2 kV
Thermal Resistance θ_{JA}	50°C/W
Lead Temperature	
Soldering (10 sec)	260°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Table 9. Maximum Continuous Working Voltage¹

Parameter	Max	Unit	Reference Standard
AC Voltage			
Bipolar Waveform	424	V peak	50-year minimum lifetime
Unipolar Waveform			
Basic Insulation	560	V peak	Maximum approved working voltage per VDE 0884 Part 2
DC Voltage			
Basic Insulation	560	V peak	Maximum approved working voltage per VDE 0884 Part 2

¹ Refers to continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more details.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES
1. PIN 12 AND PIN 19 MUST BE CONNECTED EXTERNALLY.

08111-002

Figure 2. Pin Configuration

Table 10. Pin Function Description

Pin No.	Mnemonic	Description
1	GND ₁	Ground, Logic Side.
2	V _{CC}	Logic Side Power Supply. It is recommended that a 0.1 μF and a 0.01 μF decoupling capacitor be fitted between Pin 2 and Pin 1. See Figure 35 for layout recommendations.
3	GND ₁	Ground, Logic Side.
4	RxD	Receiver Output Data. This output is high when $(A - B) \geq -30$ mV and low when $(A - B) \leq -200$ mV. The output is tristated when the receiver is disabled, that is, when RE is driven high.
5	$\overline{\text{RE}}$	Receiver Enable Input. This is an active-low input. Driving this input low enables the receiver; driving it high disables the receiver.
6	DE	Driver Enable Input. Driving this input high enables the driver; driving it low disables the driver.
7	TxD	Driver Input. Data to be transmitted by the driver is applied to this input.
8	V _{CC}	Logic Side Power Supply. It is recommended that a 0.1 μF and a 10 μF decoupling capacitor be fitted between Pin 8 and Pin 9. See Figure 35 for layout recommendations.
9	GND ₁	Ground, Logic Side.
10	GND ₁	Ground, Logic Side.
11, 14	GND ₂	Ground for Isolated DC-to-DC Converter. It is recommended to connect Pin 11 and Pin 14 together through one ferrite bead to PCB ground. See Figure 35 for layout recommendations.
12	V _{ISOOUT}	Isolated Power Supply Output. This pin must be connected externally to V _{ISOIN} . It is recommended that a reservoir capacitor of 10 μF and a decoupling capacitor of 0.1 μF be fitted between Pin 12 and Pin 11.
13	Y	Driver Noninverting Output
15	Z	Driver Inverting Output
16	GND ₂	Ground, Bus Side. Do not connect this pin to Pin 14 and Pin 11. See Figure 35 for layout recommendations.
17	B	Receiver Inverting Input.
18	A	Receiver Noninverting Input.
19	V _{ISOIN}	Isolated Power Supply Input. This pin must be connected externally to V _{ISOOUT} . It is recommended that a 0.1 μF and a 0.01 μF decoupling capacitor be fitted between Pin 19 and Pin 20. Connect this pin through a ferrite bead and short trace length to V _{ISOOUT} for operation. See Figure 35 for layout recommendations.
20	GND ₂	Ground, Bus Side.

CIRCUIT DESCRIPTION

SIGNAL ISOLATION

The ADM2582E/ADM2587E signal isolation is implemented on the logic side of the interface. The part achieves signal isolation by having a digital isolation section and a transceiver section (see Figure 1). Data applied to the TxD and DE pins and referenced to logic ground (GND_1) are coupled across an isolation barrier to appear at the transceiver section referenced to isolated ground (GND_2). Similarly, the single-ended receiver output signal, referenced to isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RXD pin referenced to logic ground.

POWER ISOLATION

The ADM2582E/ADM2587E power isolation is implemented using an isoPower integrated isolated dc-to-dc converter. The dc-to-dc converter section of the ADM2582E/ADM2587E works on principles that are common to most modern power supplies. It is a secondary side controller architecture with isolated pulse-width modulation (PWM) feedback. V_{CC} power is supplied to an oscillating circuit that switches current into a chip-scale air core transformer. Power transferred to the secondary side is rectified and regulated to 3.3 V. The secondary (V_{ISO}) side controller regulates the output by creating a PWM control signal that is sent to the primary (V_{CC}) side by a dedicated iCoupler data channel. The PWM modulates the oscillator circuit to control the power being sent to the secondary side. Feedback allows for significantly higher power and efficiency.

TRUTH TABLES

The truth tables in this section use the abbreviations found in Table 11.

Table 11. Truth Table Abbreviations

Letter	Description
H	High level
L	Low level
X	Don't care
Z	High impedance (off)
NC	Disconnected

Table 12. Transmitting (see Table 11 for Abbreviations)

Inputs		Outputs	
DE	TxD	Y	Z
H	H	H	L
H	L	L	H
L	X	Z	Z

Table 13. Receiving (see Table 11 for Abbreviations)

A – B	Inputs		Output
		\overline{RE}	RxD
≥ -0.03 V		L or NC	H
≤ -0.2 V		L or NC	L
-0.2 V < A – B < -0.03 V		L or NC	X
Inputs open		L or NC	H
X		H	Z

THERMAL SHUTDOWN

The ADM2582E/ADM2587E contain thermal shutdown circuitry that protects the parts from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a die temperature of 150°C is reached. As the device cools, the drivers are reenabled at a temperature of 140°C.

OPEN- AND SHORT-CIRCUIT, FAIL-SAFE RECEIVER INPUTS

The receiver inputs have open- and short-circuit, fail-safe features that ensure that the receiver output is high when the inputs are open or shorted. During line-idle conditions, when no driver on the bus is enabled, the voltage across a terminating resistance at the receiver input decays to 0 V. With traditional transceivers, receiver input thresholds specified between -200 mV and $+200$ mV mean that external bias resistors are required on the A and B pins to ensure that the receiver outputs are in a known state. The short-circuit, fail-safe receiver input feature eliminates the need for bias resistors by specifying the receiver input threshold between -30 mV and -200 mV. The guaranteed negative threshold means that when the voltage between A and B decays to 0 V, the receiver output is guaranteed to be high.

DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

The digital signals transmit across the isolation barrier using iCoupler technology. This technique uses chip-scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are decoded into the binary value that was originally transmitted.

Positive and negative logic transitions at the isolator input cause narrow (~ 1 ns) pulses to be sent to the decoder via the transformer. The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than 1 μ s, periodic sets of refresh pulses indicative of the correct input state are sent to ensure dc correctness at the output. If the decoder receives no internal pulses of more than approximately 5 μ s, the input side is assumed to be

unpowered or nonfunctional, in which case, the isolator output is forced to a default state by the watchdog timer circuit.

This situation should occur in the ADM2582E/ADM2587E devices only during power-up and power-down operations. The limitation on the ADM2582E/ADM2587E magnetic field immunity is set by the condition in which induced voltage in the transformer receiving coil is sufficiently large to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur.

The 3.3 V operating condition of the ADM2582E/ADM2587E is examined because it represents the most susceptible mode of operation. The pulses at the transformer output have an amplitude of >1.0 V. The decoder has a sensing threshold of about 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt)\Sigma\pi r_n^2; n = 1, 2, \dots, N$$

where:

β is magnetic flux density (gauss).

N is the number of turns in the receiving coil.

r_n is the radius of the nth turn in the receiving coil (cm).

Given the geometry of the receiving coil in the ADM2582E/ADM2587E and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 33.

Figure 33. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse (and is of the worst-case polarity), it reduces the received pulse from >1.0 V to 0.75 V, which is still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the ADM2582E/ADM2587E transformers. Figure 34 expresses these allowable current magnitudes as a function of frequency for selected distances. As shown in Figure 34, the ADM2582E/ADM2587E are extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example, a 0.5 kA current must be placed 5 mm away from the ADM2582E/ADM2587E to affect component operation.

Figure 34. Maximum Allowable Current for Various Current-to-ADM2582E/ADM2587E Spacings

Note that in combinations of strong magnetic field and high frequency, any loops formed by printed circuit board (PCB) traces can induce error voltages sufficiently large to trigger the thresholds of succeeding circuitry. Take care in the layout of such traces to avoid this possibility.

APPLICATIONS INFORMATION

PCB LAYOUT AND ELECTROMAGNETIC INTERFERENCE (EMI)

The [ADM2582E/ADM2587E](#) isolated RS-422/RS-485 transceiver contains an *isoPower* integrated dc-to-dc converter, requiring no external interface circuitry for the logic interfaces. Power supply bypassing is required at the input and output supply pins (see Figure 35). The power supply section of the [ADM2582E/ADM2587E](#) uses a 180 MHz oscillator frequency to pass power efficiently through its chip-scale transformers. In addition, the normal operation of the data section of the *iCoupler* introduces switching transients on the power supply pins.

Bypass capacitors are required for several operating frequencies. Noise suppression requires a low inductance, high frequency capacitor, whereas ripple suppression and proper regulation require a large value capacitor. These capacitors are connected between Pin 1 (GND₁) and Pin 2 (V_{CC}) and Pin 8 (V_{CC}) and Pin 9 (GND₁) for V_{CC}. The V_{ISOIN} and V_{ISOOUT} capacitors are connected between Pin 11 (GND₂) and Pin 12 (V_{ISOOUT}) and Pin 19 (V_{ISOIN}) and Pin 20 (GND₂). To suppress noise and reduce ripple, a parallel combination of at least two capacitors is required with the smaller of the two capacitors located closest to the device. The recommended capacitor values are 0.1 μF and 10 μF for V_{ISOOUT} at Pin 11 and Pin 12 and V_{CC} at Pin 8 and Pin 9. Capacitor values of 0.01 μF and 0.1 μF are recommended for V_{ISOIN} at Pin 19 and Pin 20 and V_{CC} at Pin 1 and Pin 2. The recommended best practice is to use a very low inductance ceramic capacitor, or its equivalent, for the smaller value. The total lead length between both ends of the capacitor and the input power supply pin should not exceed 10 mm.

The dc-to-dc converter section of the [ADM2582E/ADM2587E](#) components must operate, out of necessity, at a very high frequency to allow efficient power transfer through the small transformers. This creates high frequency currents that can propagate in circuit board ground and power planes, causing edge and dipole radiation.

The [ADM2582E/ADM2587E](#) features an internal split paddle, lead frame on the bus side. For the best noise suppression, filter both the GND₂ pins (Pin 11 and Pin 14) and V_{ISOOUT} signals of the integrated dc-to-dc converter for high frequency currents. Use surface-mount ferrite beads in series with the signals before routing back to the device. See Figure 35 for the recommended PCB layout. The impedance of the ferrite bead is chosen to be about 2 kΩ between the 100 MHz and 1 GHz frequency range to reduce the emissions at the 180 MHz primary switching

frequency and the 360 MHz secondary side rectifying frequency and harmonics.

To pass the EN55022 radiated emissions standard, the following additional layout guidelines are recommended:

- Do not connect the V_{ISOOUT} pin to a power plane; connect between V_{ISOOUT} and V_{ISOIN} using a PCB trace. Ensure that V_{ISOIN} (Pin 19) connects through the L1 ferrite to V_{ISOOUT} (Pin 12), as shown in Figure 35.
- If using a four layer PCB, place an embedded stitching capacitor between GND₁ and GND₂ using internal layers of the PCB planes. An embedded PCB capacitor is created when two metal planes in a PCB overlap each other and are separated by dielectric material. This capacitor provides a return path for high frequency common-mode noise currents across the isolation gap.
- If using a two layer PCB, place a high voltage discrete capacitor that connects between GND₁ (Pin 10) and GND₂ (Pin 11). This capacitor provides a return path for high frequency common-mode noise currents across the isolation gap.
- Ensure that GND₂ (Pin 14) connects to GND₂ (Pin 11) on the inside (device side) of the C1 100 nF capacitor.
- Ensure that the C1 capacitor connects between V_{ISOOUT} (Pin 12) and GND₂ (Pin 11) on the device side of the L1 and L2 ferrites.
- Ensure that GND₂ (Pin 16) is connected to GND₂ (Pin 11) on the outside (bus side) of the L2 ferrite, as shown in Figure 35.
- Ensure that there is a keep out area for the GND₂ plane in the PCB layout around the L1 and L2 ferrites. The keep out area means there must not be a GND₂ fill on any layer below the L1 and L2 ferrites.
- Locate the power delivery circuit in close proximity to the [ADM2582E/ADM2587E](#) device, so that the V_{CC} trace is as short as possible.

See the [AN-1349](#) Application Note, *PCB Implementation Guidelines to Minimize Radiated Emissions on the ADM2582E/ADM2587E RS-485/RS-422 Transceivers*, for more information. Evaluation boards and user guides are available for two layer and four layer PCB EN55022 radiated emissions compliant designs. See [UG-916](#) and [UG-044](#) for more information.

Figure 35. Recommended PCB Layout

In applications involving high common-mode transients, ensure that board coupling across the isolation barrier is minimized. Furthermore, design the board layout such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins exceeding the absolute maximum ratings for the device, thereby leading to latch-up and/or permanent damage.

The ADM2582E/ADM2587E dissipate approximately 650 mW of power when fully loaded. Because it is not possible to apply a heat sink to an isolation device, the devices primarily depend on heat dissipation into the PCB through the GND pins. If the devices are used at high ambient temperatures, provide a thermal path from the GND pins to the PCB ground plane. The board layout in Figure 35 shows enlarged pads for Pin 1, Pin 3, Pin 9, Pin 10, Pin 11, Pin 14, Pin 16, and Pin 20. Implement multiple vias from the pad to the ground plane to reduce the temperature inside the chip significantly. The dimensions of the expanded pads are at the discretion of the designer and dependent on the available board space.

INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. Analog Devices conducts an extensive set of evaluations to determine the lifetime of the insulation structure within the ADM2582E/ADM2587E.

Accelerated life testing is performed using voltage levels higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined, allowing calculation of the time to failure at the working voltage of interest. The values shown in Table 9 summarize the peak voltages for 50 years of service life in several operating conditions. In many cases, the working voltage approved by agency testing is higher than the 50-year service life voltage. Operation at working voltages higher than the service life voltage listed leads to premature insulation failure.

The insulation lifetime of the ADM2582E/ADM2587E depends on the voltage waveform type imposed across the isolation barrier. The iCoupler insulation structure degrades at different rates, depending on whether the waveform is bipolar ac, unipolar ac, or dc. Figure 36, Figure 37, and Figure 38 illustrate these different isolation voltage waveforms.

Bipolar ac voltage is the most stringent environment. A 50-year operating lifetime under the bipolar ac condition determines the Analog Devices recommended maximum working voltage.

In the case of unipolar ac or dc voltage, the stress on the insulation is significantly lower. This allows operation at higher working voltages while still achieving a 50-year service life. The working voltages listed in Table 9 can be applied while maintaining the 50-year minimum lifetime, provided the voltage conforms to either the unipolar ac or dc voltage cases. Any cross insulation voltage waveform that does not conform to Figure 37 or Figure 38 should be treated as a bipolar ac waveform, and its peak voltage should be limited to the 50-year lifetime voltage value listed in Table 9.

NOTES

1. THE VOLTAGE IS SHOWN AS SINUSOIDAL FOR ILLUSTRATION PURPOSES ONLY. IT IS MEANT TO REPRESENT ANY VOLTAGE WAVEFORM VARYING BETWEEN 0 AND SOME LIMITING VALUE. THE LIMITING VALUE CAN BE POSITIVE OR NEGATIVE, BUT THE VOLTAGE CANNOT CROSS 0V.

Figure 38. Unipolar AC Waveform

ISOLATED POWER SUPPLY CONSIDERATIONS

The typical output voltage of the integrated *isoPower* dc-to-dc isolated supply is 3.3 V. The isolated supply in the ADM2587E is capable of supplying a current of 55 mA when the junction temperature of the device is kept below 120°C. It is important to note that the current available on the V_{ISOOUT} pin is the total current available and includes the current required to supply the internal RS-485 circuitry.

The ADM2587E can typically supply 15 mA externally on V_{ISOOUT} when the driver is switching at 500 kbps loaded with 54 Ω, while the junction temperature of the part is less than 120°C.

Table 14. Typical Maximum External Current Available on V_{ISOOUT}

External Load Current (mA)	R _T	System Configuration
15	54 Ω	Double terminated bus with R _T = 110 Ω
29	120 Ω	Single terminated bus
46	Unloaded	Unterminated bus

The ADM2582E typically has no current available externally on V_{ISOOUT}.

When external current is drawn from the V_{ISOOUT} pin, there is an increased risk of generating radiated emissions due to the high frequency switching elements used in the *isoPower* dc-to-dc converter. Special care must be taken during PCB layout to meet emissions standards. See Application Note AN-0971, *Control of Radiated Emissions with isoPower Devices*, for details on board layout considerations.

Figure 39. ADM2587E Typical Maximum External Current Measurements

TYPICAL APPLICATIONS

An example application of the [ADM2582E/ADM2587E](#) for a full-duplex RS-485 node is shown in the circuit diagram of Figure 40. Refer to the PCB Layout and Electromagnetic Interference (EMI) section for the recommended placement of the capacitors shown in this circuit diagram. Placement of the R_T termination resistor depends on the location of the node and the network configuration. Refer to the [AN-960 Application Note, RS-485/RS-422 Circuit Implementation Guide](#), for guidance on termination.

Figure 41 and Figure 42 show typical applications of the [ADM2582E/ADM2587E](#) in half duplex and full duplex RS-485 network configurations. Up to 256 transceivers can be connected to the RS-485 bus. To minimize reflections, terminate the line at the receiving end in its characteristic impedance and keep stub lengths off the main line as short as possible. For half-duplex operation, this means that both ends of the line must be terminated because either end can be the receiving end.
