ADP3110A

Dual Bootstrapped, 12 V MOSFET Driver with Output Disable

The ADP3110A is a single Phase 12 V MOSFET gate drivers optimized to drive the gates of both high-side and low-side power MOSFETs in a synchronous buck converter. The high-side and low-side driver is capable of driving a 3000 pF load with a 25 ns propagation delay and a 30 ns transition time.

With a wide operating voltage range, high or low side MOSFET gate drive voltage can be optimized for the best efficiency. Internal adaptive nonoverlap circuitry further reduces switching losses by preventing simultaneous conduction of both MOSFETs.

The floating top driver design can accommodate VBST voltages as high as 35 V, with transient voltages as high as 40 V. Both gate outputs can be driven low by applying a low logic level to the Output Disable (\overline{OD}) pin. An Undervoltage Lockout function ensures that both driver outputs are low when the supply voltage is low, and a Thermal Shutdown function provides the IC with overtemperature protection.

Features

- All-In-One Synchronous Buck Driver
- Bootstrapped High-Side Drive
- One PWM Signal Generates Both Drives
- Anticross Conduction Protection Circuitry
- \overline{OD} for Disabling the Driver Outputs Meets CPU VR Requirement when Used with Patented FlexMode™ Controller
- These are Pb-Free Devices

Applications

- Multiphase Desktop CPU Supplies
- Single-Supply Synchronous Buck Converters

ADP3110A

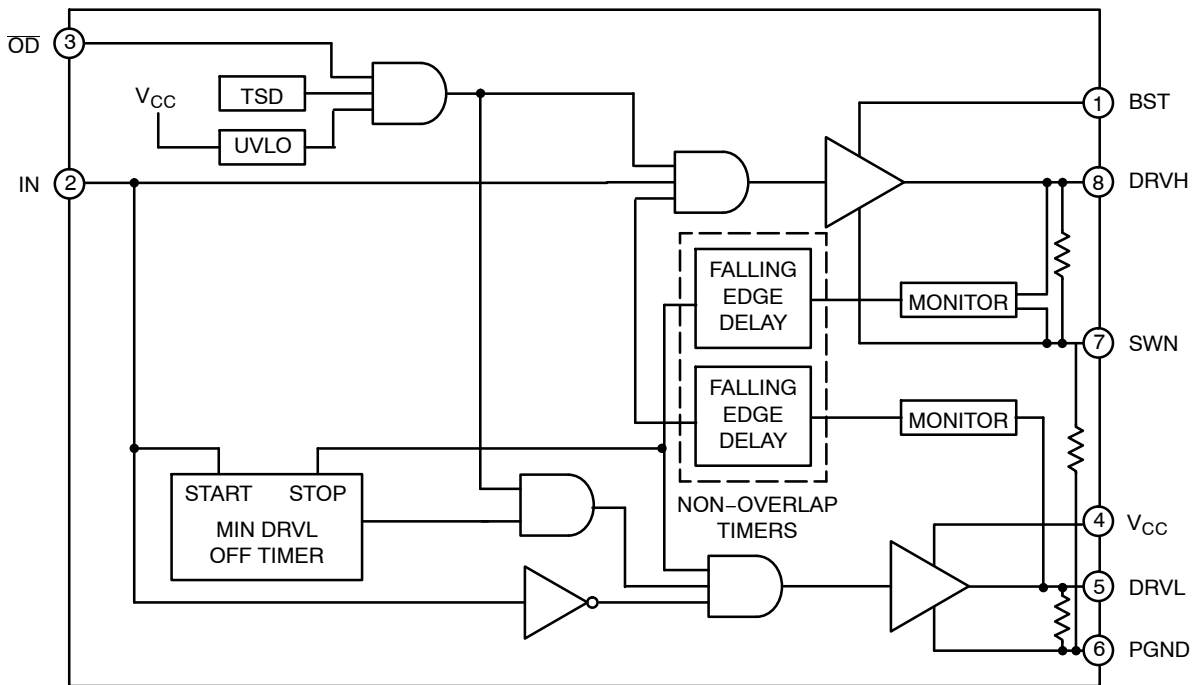

Figure 1. Block Diagram

PIN DESCRIPTION

SO-8	DFN8	Symbol	Description
1	1	BST	Upper MOSFET Floating Bootstrap Supply. A capacitor connected between BST and SW pins holds this bootstrap voltage for the high-side MOSFET as it is switched. The recommended capacitor value is between 100 nF and 1.0 μ F. An external diode is required with the ADP3110A.
2	2	IN	Logic-Level Input. This pin has primary control of the drive outputs.
3	3	\overline{OD}	Output Disable. When low, normal operation is disabled forcing DRVH and DRVL low.
4	4	V _{CC}	Input Supply. A 1.0 μ F ceramic capacitor should be connected from this pin to PGND.
5	5	DRVL	Output drive for the lower MOSFET.
6	6	PGND	Power Ground. Should be closely connected to the source of the lower MOSFET.
7	7	SWN	Switch Node. Connect to the source of the upper MOSFET.
8	8	DRVH	Output drive for the upper MOSFET.

ADP3110A

MAXIMUM RATINGS

Rating	Value	Unit
Operating Ambient Temperature, T_A	0 to 85	°C
Operating Junction Temperature, T_J (Note 1)	0 to 150	°C
Package Thermal Resistance: SO-8 Junction-to-Case, $R_{\theta JC}$ Junction-to-Ambient, $R_{\theta JA}$ (2-Layer Board)	45 123	°C/W °C/W
Package Thermal Resistance: DFN8 (Note 2) Junction-to-Case, $R_{\theta JC}$ (From die to exposed pad) Junction-to-Ambient, $R_{\theta JA}$	7.5 55	°C/W °C/W
Storage Temperature Range, T_S	-65 to 150	°C
Lead Temperature Soldering (10 sec): Reflow (SMD styles only) Pb-Free (Note 3)	260 peak	°C
JEDEC Moisture Sensitivity Level SO-8 (260 peak profile)	1	-

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Internally limited by thermal shutdown, 150°C min.
2. 2 layer board, 1 in² Cu, 1 oz thickness.
3. 60–180 seconds minimum above 237°C.

NOTE: This device is ESD sensitive. Use standard ESD precautions when handling.

MAXIMUM RATINGS

Pin Symbol	Pin Name	V_{MAX}	V_{MIN}
V_{CC}	Main Supply Voltage Input	15 V	-0.3 V
PGND	Ground	0 V	0 V
BST	Bootstrap Supply Voltage Input	35 V wrt/PGND 40 V < 50 ns wrt/PGND 15 V wrt/SW	-0.3 V wrt/SW
SW	Switching Node (Bootstrap Supply Return)	35 V 40 V < 50 ns	-5.0 V -10 V < 200 ns
DRVH	High-Side Driver Output	BST + 0.3 V	-0.3 V wrt/SW - 2.0 V < 200 ns wrt/SW

4. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC).

5. For propagation delays, “tpdh” refers to the specified signal going high; “tpdl” refers to it going low.

6. Guaranteed by design; not tested in production.

APPLICATIONS INFORMATION

Theory of Operation

The ADP3110A are single phase MOSFET drivers designed for driving two N-channel MOSFETs in a synchronous buck converter topology. The ADP3110A will operate from 5.0 V or 12 V, but have been optimized for high current multi-phase buck regulators that convert 12 V rail directly to the core voltage required by complex logic chips. A single PWM input signal is all that is required to properly drive the high-side and the low-side MOSFETs. Each driver is capable of driving a 3 nF load at frequencies up to 1 MHz.

Low-Side Driver

The low-side driver is designed to drive a ground-referenced low $R_{DS(on)}$ N-Channel MOSFET. The voltage rail for the low-side driver is internally connected to the VCC supply and PGND.

High-Side Driver

The high-side driver is designed to drive a floating low $R_{DS(on)}$ N-channel MOSFET. The gate voltage for the high side driver is developed by a bootstrap circuit referenced to Switch Node (SW) pin.

The bootstrap circuit is comprised of an external diode, and an external bootstrap capacitor. When the ADP3110A are starting up, the SW pin is at ground, so the bootstrap capacitor will charge up to VCC through the bootstrap diode. See Figure 4. When the PWM input goes high, the high-side driver will begin to turn on the high-side MOSFET using the stored charge of the bootstrap capacitor. As the high-side MOSFET turns on, the SW pin will rise. When the high-side MOSFET is fully on, the switch node will be at 12 V, and the BST pin will be at 12 V plus the charge of the bootstrap capacitor (approaching 24 V).

The bootstrap capacitor is recharged when the switch node goes low during the next cycle.

Safety Timer and Overlap Protection Circuit

It is very important that MOSFETs in a synchronous buck regulator do not both conduct at the same time. Excessive shoot-through or cross conduction can damage the MOSFETs, and even a small amount of cross conduction will cause a decrease in the power conversion efficiency.

The ADP3110A prevent cross conduction by monitoring the status of the external mosfets and applying the appropriate amount of “dead-time” or the time between the turn off of one MOSFET and the turn on of the other MOSFET.

When the PWM input pin goes high, DRVL will go low after a propagation delay ($t_{pdIDRVL}$). The time it takes for the low-side MOSFET to turn off (t_{fDRVL}) is dependent on the total charge on the low-side MOSFET gate. The ADP3110A monitor the gate voltage of both MOSFETs and the switchnode voltage to determine the conduction status of the MOSFETs. Once the low-side MOSFET is turned off an internal timer will delay ($t_{pdhDRVH}$) the turn on of the high-side MOSFET

Likewise, when the PWM input pin goes low, DRVH will go low after the propagation delay (t_{pdDRVH}). The time to turn off the high-side MOSFET (t_{fDRVH}) is dependent on the total gate charge of the high-side MOSFET. A timer will be triggered once the high-side mosfet has stopped conducting, to delay ($t_{pdhDRVL}$) the turn on of the low-side MOSFET

Power Supply Decoupling

The ADP3110A can source and sink relatively large currents to the gate pins of the external MOSFETs. In order to maintain a constant and stable supply voltage (V_{CC}) a low ESR capacitor should be placed near the power and ground pins. A 1 μ F to 4.7 μ F multi layer ceramic capacitor (MLCC) is usually sufficient.

Input Pins

The PWM input and the Output Disable pins of the ADP3110A have internal protection for Electro Static Discharge (ESD), but in normal operation they present a relatively high input impedance. If the PWM controller does not have internal pulldown resistors, they should be added externally to ensure that the driver outputs do not go high before the controller has reached its under voltage lockout threshold. The NCP5381 controller does include a passive internal pull-down resistor on the drive-on output pin.

Bootstrap Circuit

The bootstrap circuit uses a charge storage capacitor (C_{BST}) and the internal (or an external) diode. Selection of these components can be done after the high-side MOSFET has been chosen. The bootstrap capacitor must have a voltage rating that is able to withstand twice the maximum supply voltage. A minimum 50 V rating is recommended. The capacitance is determined using the following equation:

$$C_{BST} = \frac{Q_{GATE}}{\Delta V_{BST}}$$

where Q_{GATE} is the total gate charge of the high-side MOSFET, and ΔV_{BST} is the voltage droop allowed on the high-side MOSFET drive. For example, a NTD60N03 has a total gate charge of about 30 nC. For an allowed droop of 300 mV, the required bootstrap capacitance is 100 nF. A good quality ceramic capacitor should be used.

The bootstrap diode must be rated to withstand the maximum supply voltage plus any peak ringing voltages that may be present on SW. The average forward current can be estimated by:

$$I_{F(AVG)} = Q_{GATE} \times f_{MAX}$$

where f_{MAX} is the maximum switching frequency of the controller. The peak surge current rating should be checked in-circuit, since this is dependent on the source impedance of the 12 V supply and the ESR of C_{BST} .

DESCRIPTION:	SOIC-8 NB	PAGE 2 OF 2

onsemi and **ONSEMI** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
