

THE DATASHEET OF TDE1767ADP

Interface circuit (relay and lamp driver)

Datasheet - production data

Features

- Open ground protection
- High output current
- Adjustable short-circuit protection
- Internal thermal protection with external reset
- Large supply voltage range
- Alarm output
- Input voltage can be higher than V_{CC}
- Output voltage can be lower than ground ($V_{CC} - V_O \leq V_{CC(max.)}$)

Description

This device is a monolithic amplifier designed for high current and high voltage applications,

specifically to drive lamps, relays, stepping motors. It is a blow-out proof device whose output is protected against overload and short-circuits. This output is low in open ground conditions and in case of overload and reset for high input, it switches on and off alternately until the overload is removed. The LED, driven by an alarm output, if referred to ground, flashes during an overload depending on the state of the reset input. The thermal shutdown prevents the IC from overheating, so if the internal dissipation becomes too high, the driver shuts down. The device works over a wide range of voltages from standard 15 V operational amplifier to the single +6 V or +48 V used for industrial electric systems.

		$V_O = 0\text{ V}$, $t = 10\text{ ms}$	120	140	165	
$V_{O(sat)}$	Output saturation voltage	Output high $V_I^+ - V_I^- \geq 50\text{ mV}$; $R_{SC} = 0$; $V_{CC} = 30\text{ V}$ $T_J = 25\text{ }^{\circ}\text{C}$		1	1.1	V
		$T_J = 150\text{ }^{\circ}\text{C}$		1.1	1.2	V
I_{OL}	Output leakage current	Output low			100	μA
I_A	Available alarm output current	Output source current $V_{AH} = V_{CC} - 2.5\text{ V}$	-4	-5		mA
		Output sink current in thermal shutdown $V_A = 1.4\text{ V}$	5	10		mA
I_{reset}	Reset input current			2	40	μA
V_{th_reset}	Reset threshold			1.4		V
I_{LGND}	Output leakage current	Open ground		10		μA

Notes:

⁽¹⁾The offset voltage given is the maximum value of different input voltage required to drive the output voltage within 2 V of ground or the supply voltage.

⁽²⁾Input voltage range is independent of the supply voltage.
