### Description

The IDT71V424 is a 4,194,304-bit high-speed Static RAM organized as 512K x 8. It is fabricated using high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs.

The IDT71V424 has an output enable pin which operates as fast as 5ns, with address access times as fast as 10ns. All bidirectional inputs and outputs of the IDT71V424 are TTL-compatible and operation is from a single 3.3V supply. Fully static asynchronous circuitry is used, requiring no clocks or refresh for operation.

The IDT71V424 is packaged in a 36-pin, 400 mil Plastic SOJ and 44-pin, 400 mil TSOP.

### Timing Waveform of Read Cycle No. 1<sup>(1)</sup>

3622 drw 06

### Timing Waveform of Read Cycle No. 2<sup>(1, 2, 4)</sup>

3622 drw 07

**NOTES:**

1.  $\overline{WE}$  is HIGH for Read Cycle.
2. Device is continuously selected,  $\overline{CS}$  is LOW.
3. Address must be valid prior to or coincident with the later of  $\overline{CS}$  transition LOW; otherwise  $t_{AA}$  is the limiting parameter.
4.  $\overline{OE}$  is LOW.
5. Transition is measured  $\pm 200\text{mV}$  from steady state.

Timing Waveform of Write Cycle No. 1 ( $\overline{WE}$  Controlled Timing)<sup>(1, 2, 4)</sup>

Timing Waveform of Write Cycle No. 2 ( $\overline{CS}$  Controlled Timing)<sup>(1, 4)</sup>

NOTES:

1. A write occurs during the overlap of a LOW  $\overline{CS}$  and a LOW  $\overline{WE}$ .
2.  $\overline{OE}$  is continuously HIGH. During a  $\overline{WE}$  controlled write cycle with  $\overline{OE}$  LOW,  $t_{WP}$  must be greater than or equal to  $t_{WHZ} + t_{DW}$  to allow the I/O drivers to turn off and data to be placed on the bus for the required  $t_{OW}$ . If  $\overline{OE}$  is HIGH during a  $\overline{WE}$  controlled write cycle, this requirement does not apply and the minimum write pulse is the specified  $t_{WP}$ .
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the  $\overline{CS}$  LOW transition occurs simultaneously with or after the  $\overline{WE}$  LOW transition, the outputs remain in a high impedance state.  $\overline{CS}$  must be active during the  $t_{OW}$  write period.
5. Transition is measured  $\pm 200\text{mV}$  from steady state.
