

AN1431T, AN1431M

Variable output shunt regulator

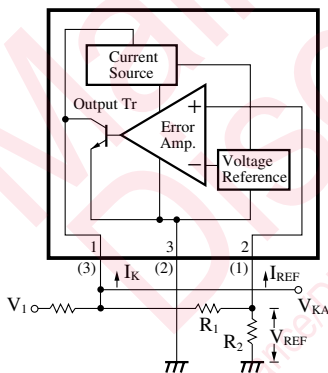

■ Overview

The AN1431T and AN1431M are highly accurate stabilized power supplies in which the output voltage can be adjusted in the range from approximately 2.5 to 36V under the operating temperature by using the external resistor. Because of its fast rising characteristic, it can be used as a Zener diode and has the wide application.

■ Features

- High precision reference voltage: 2.5V (allowance: $\pm 2\%$)
- High temperature stability: 17ppm/ $^{\circ}\text{C}$ typ.
- Output voltage externally adjustable: 2.5 to 36V
- Fast rising output
- Low input impedance: 0.2 Ω typ.
- Low output noise voltage

Note) The number in () shows the pin number for the AN1431M.

$$V_{KA} = V_{REF} \left(1 + \frac{R_1}{R_2} \right) + I_{REF} \cdot R_1$$

$$R_2 = 2.5\text{k}\Omega$$

*1

The temperature coefficient aV_{REF} for the reference input voltage is equivalently given by the following expression.

$$|aV_{REF}| = \frac{V_{REF(dev)}}{V_{REF}^2} \times 10^6 \text{ (ppm/}^\circ\text{C)} \quad \dagger V_{REF} \text{ at } T_a = 25^\circ\text{C}$$

For example, assuming $V_{REF(max)} = 2500\text{mV}$ ($T_a = 30^\circ\text{C}$), $V_{REF(min)} = 2497\text{mV}$ ($T_a = 0^\circ\text{C}$), ($V_{REF(dev)} = 3\text{mV}$) and

$$V_{REF} = 2499\text{mV} \text{ (} T_a = 25^\circ\text{C) } \Delta T_a = 70^\circ\text{C}$$

$$\text{then, } |aV_{REF}| = \frac{3\text{mV}}{2499\text{mV}} \times 10^6 = 17.1 \text{ (ppm/}^\circ\text{C)}$$

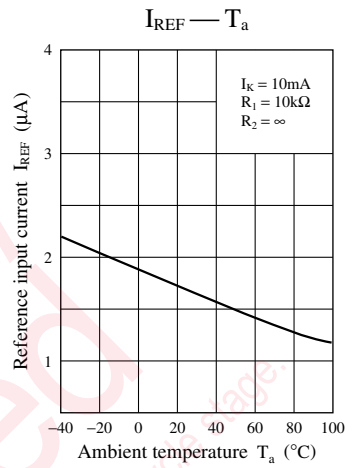

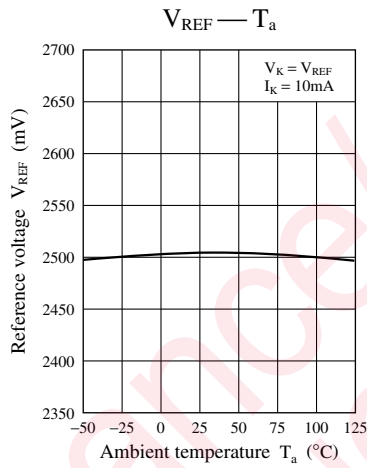

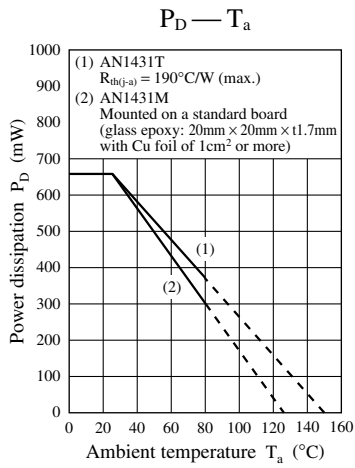

*2 These values are design reference values, not guaranteed ones.

*3 The dynamic impedance is defined by the following expression. $|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$

The total dynamic impedance at ΔV_{REF} , ΔV_{KA} , I_{REF} and $I_{REF(dev)}$ is as follows.

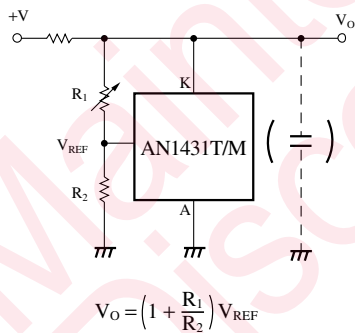

$$|Z| = \frac{\Delta V}{\Delta I} = |Z_{KA}| \left(1 + \frac{R_1}{R_2}\right)$$
