

**THE DATASHEET OF  
ADM6339CARJZ-RL7**

### FEATURES

**Accurate monitoring of up to four power supply voltages**  
**6 factory-set threshold options:  $-5.0\text{ V}$ ,  $+1.8\text{ V}$ ,  $+2.5\text{ V}$ ,  $+3.0\text{ V}$ ,  $+3.3\text{ V}$ , and  $+5.0\text{ V}$**   
**Adjustable input threshold options:  $-0.5\text{ V}$  ( $\pm 2.0\%$  accuracy),  $+0.62\text{ V}$  ( $\pm 0.8\%$  accuracy), and  $+1.23\text{ V}$**   
**200 ms typical reset timeout**  
**Open-drain  $\overline{\text{RESET}}$  output (10  $\mu\text{A}$  internal pull-up)**  
**Reset output stage: active low, valid to  $\text{IN}_1 = 1\text{ V}$  or  $\text{IN}_2 = 1\text{ V}$**   
**Low power consumption (55  $\mu\text{A}$ )**  
**Glitch immunity**  
**Specified from  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$**   
**6-lead SOT-23 package**

### APPLICATIONS

**Telecommunications**  
**Microprocessor systems**  
**Data storage equipment**  
**Servers/workstations**

### GENERAL DESCRIPTION

The ADM6339 is a high accuracy supervisory circuit capable of monitoring up to four system supply voltages.

The ADM6339 incorporates a variety of internally pretrimmed undervoltage threshold options for monitoring  $-5.0\text{ V}$ ,  $+1.8\text{ V}$ ,  $+2.5\text{ V}$ ,  $+3.0\text{ V}$ ,  $+3.3\text{ V}$ , and  $+5.0\text{ V}$  supply voltages. Tolerance levels of  $\pm 5\%$  and  $\pm 10\%$  are available. The device is also available with one to three adjustable threshold options. The adjustable voltage threshold options are  $+1.23\text{ V}$ ,  $+0.62\text{ V}$ , and  $-0.5\text{ V}$ . See the Ordering Guide section for a list and description of all available options.

If a monitored power supply voltage decreases below the minimum voltage threshold (or rises above the maximum voltage threshold for the  $-0.5\text{ V}$  and  $-5.0\text{ V}$  input options), a single

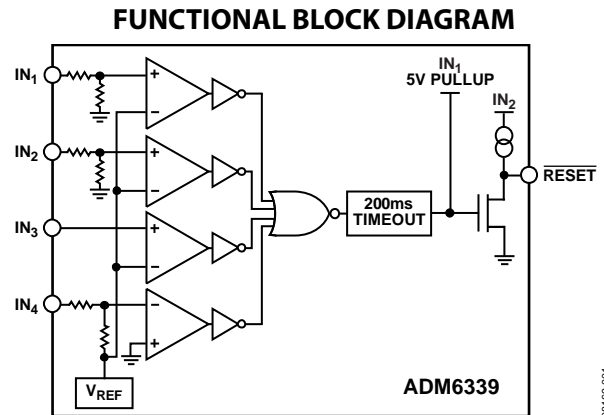

Figure 1.

active low output asserts, triggering a system reset. The output is open drain with a weak internal pull-up to the monitored  $\text{IN}_2$  supply of typically  $10\ \mu\text{A}$ . After all voltages exceed the selected threshold level, the reset signal remains low for the reset timeout period (200 ms typical).

The ADM6339 output remains valid as long as  $\text{IN}_1$  or  $\text{IN}_2$  exceeds 1 V. Unused monitored inputs should not be allowed to float or to be grounded; instead, they should be connected to a supply voltage greater than their specified threshold voltages.

The ADM6339 is available in a 6-lead SOT-23 package. The device operates over the extended temperature range of  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ .

$V_{INx}$ Increasing	-0.497	-0.487	-0.477	V	-0.5 V threshold.
RESET THRESHOLD HYSTERESIS ( $V_{HYST}$ )		0.3		% $V_{TH}$	
		0.47		% $V_{TH}$	IN <sub>4</sub> , ADM6339Q model.
RESET THRESHOLD TEMPERATURE COEFFICIENT ( $TCV_{TH}$ )		60		ppm/°C	
IN <sub>x</sub> to RESET DELAY ( $t_{RD}$ )		30		μs	$V_{INx} = V_{TH}$ to ( $V_{TH} - 50\text{ mV}$ ) for all inputs except -0.5 V and -5.0 V; $V_{INx} = V_{TH}$ to ( $V_{TH} + 50\text{ mV}$ ) for -5.0 V and -0.5 V inputs only.
RESET TIMEOUT PERIOD ( $t_{RP}$ )	140	200	280	ms	
RESET OUTPUT LOW ( $V_{OL}$ )			0.4	V	$V_{IN2} = 5.0\text{ V}$ , $I_{SINK} = 2\text{ mA}$ .
			0.4	V	$V_{IN2} = 2.5\text{ V}$ , $I_{SINK} = 1.2\text{ mA}$ .
			0.4	V	$V_{IN2} = V_{IN1} = 1\text{ V}$ , $I_{SINK} = 50\text{ μA}$ .
			0.4	V	$V_{IN1} = 1\text{ V}$ , $V_{IN2} = 0\text{ V}$ , $I_{SINK} = 20\text{ μA}$
			0.4	V	$V_{IN1} = 0\text{ V}$ , $V_{IN2} = 1\text{ V}$ , $I_{SINK} = 20\text{ μA}$
RESET OUTPUT HIGH ( $V_{OH}$ )	$0.8 \times V_{IN2}$			V	$V_{IN2} \geq 2.55\text{ V}$ , $I_{SOURCE} = 6\text{ μA}$ , RESET not asserted.
RESET OUTPUT HIGH SOURCE CURRENT ( $I_{OH}$ )		10		μA	$V_{IN2} \geq 2.55\text{ V}$ , RESET not asserted.

<sup>1</sup> The device is powered by Input IN<sub>2</sub>.

<sup>2</sup> The RESET output is guaranteed to be in the correct state for IN<sub>1</sub> or IN<sub>2</sub> down to 1 V.

# ADM6339

## ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
$V_{CC}$ , $\overline{\text{RESET}}$ , GND	-0.3 V to +6 V
Continuous $\overline{\text{RESET}}$ Current	20 mA
$I_{N_x}$ (Positive Reset Threshold)	-0.3 V to +6 V
$I_{N_4}$ (Negative Reset Threshold, -5 V)	-6 V to +0.3 V
$I_{N_4}$ ADM6339Q Model (Negative Reset Threshold, -0.5 V)	-2 V to +0.3 V
Storage Temperature Range	-65°C to +125°C
Operating Temperature Range	-40°C to +85°C
Lead Temperature (10 sec)	300°C
Junction Temperature	135°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Thermal Resistance

Package Type	$\theta_{JA}$	Unit
6-Lead SOT-23	169.5	°C/W

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	IN <sub>1</sub>	Monitored Input Voltage 1.
2	IN <sub>2</sub>	Monitored Input Voltage 2. IN <sub>2</sub> is the power supply input for the ADM6339.
3	IN <sub>3</sub>	Monitored Input Voltage 3.
4	IN <sub>4</sub>	Monitored Input Voltage 4.
5	GND	Ground.
6	$\overline{\text{RESET}}$	Active Low $\overline{\text{RESET}}$ Output. $\overline{\text{RESET}}$ goes low when an input drops below the specified threshold (or above in the case of the $-0.5\text{ V}$ and $-5.0\text{ V}$ input options). After all inputs rise above the threshold voltage, $\overline{\text{RESET}}$ remains low for 200 ms (typical) before going high. $\overline{\text{RESET}}$ is open drain with a weak internal pull-up to IN <sub>2</sub> , typically 10 $\mu\text{A}$ .

## TYPICAL PERFORMANCE CHARACTERISTICS

## THEORY OF OPERATION

The ADM6339 is a compact, low power supervisory circuit that is capable of monitoring up to four voltages in a multisupply application.

The device includes several factory-set voltage threshold options for monitoring  $-5.0\text{ V}$ ,  $+1.8\text{ V}$ ,  $+2.5\text{ V}$ ,  $+3.0\text{ V}$ ,  $+3.3\text{ V}$ , and  $+5.0\text{ V}$  supplies. The ADM6339 is available with one to three adjustable threshold options. The adjustable voltage threshold options available are  $+1.23\text{ V}$ ,  $+0.62\text{ V}$ , and  $-0.5\text{ V}$ . See the Ordering Guide section for a list and description of all available options.

## INPUT CONFIGURATION

Built-in hysteresis improves the ADM6339's immunity to short input transients, without noticeably reducing the threshold accuracy. The internal comparators each have a hysteresis of 0.3% with respect to the reset threshold voltage. (The  $\text{IN}_4$  input of the ADM6339Q model has a hysteresis of 0.47% with respect to its reset threshold voltage of  $-0.487\text{ V}$ .)

Monitored inputs are resistant to short power supply glitches. Figure 6 depicts the ADM6339 glitch immunity data. To increase noise immunity in noisy applications, place a  $0.1\text{ }\mu\text{F}$  capacitor between the  $\text{IN}_2$  input and ground. Adding capacitance to  $\text{IN}_1$ ,  $\text{IN}_3$ , and  $\text{IN}_4$  also improves noise immunity.

Figure 13. Typical Applications Circuit

$\text{IN}_2$  must always be used for normal operation because it is the device's power supply input. Do not allow unused monitor inputs to float or to be grounded. Unused  $\text{IN}_3$  or  $\text{IN}_4$  inputs with positive thresholds can be connected directly to the  $\text{IN}_2$  input. Unused  $\text{IN}_4$  options with negative thresholds must be tied to a more negative supply.

## MONITORING NEGATIVE VOLTAGES $< -5.0\text{ V}$

A number of ADM6339 models include a pretrimmed threshold option to monitor  $-5.0\text{ V}$  voltage levels. Use a low impedance resistor divider network similar to that shown in Figure 14 to monitor supplies more negative than  $-5.0\text{ V}$ .

The current through the external resistor divider should be greater than the input current for the  $-5.0\text{ V}$  monitor options.

For an input monitor current error of  $<1\%$ , the resistor network current should be greater than or equal to  $2\text{ mA}$  (for  $I_{\text{IN}4} = 20\text{ }\mu\text{A}$  maximum). Set  $R_2 = 2.5\text{ k}\Omega$ . Calculate  $R_1$  based on the desired  $V_{\text{INTH}}$  reset threshold voltage, using the following equation:

$$R_1 = R_2((V_{\text{INTH}}/V_{\text{TH}}) - 1)$$

where:

$$R_2 \leq 2.49\text{ k}\Omega.$$

$V_{\text{INTH}}$  is the desired threshold voltage.

$V_{\text{TH}}$  is the internal threshold voltage.

For example, when monitoring a nominal voltage of  $-12\text{ V}$ ,  $V_{\text{INTH}} = -11.1\text{ V}$ ,  $V_{\text{TH}} = -4.63\text{ V}$ , and  $R_2 = 2.49\text{ k}\Omega$ . Therefore, using the previous equation,  $R_1 = 3.48\text{ k}\Omega$ .

Figure 14. Negative Voltage Monitoring

## USER ADJUSTABLE THRESHOLD OPTIONS

The ADM6339 offers the choice of three adjustable  $\text{IN}_x$  input threshold voltages:  $+1.23\text{ V}$ ,  $+0.62\text{ V}$ , or  $-0.5\text{ V}$ .

When using an adjustable threshold of  $1.23\text{ V}$  (typical), to monitor a voltage greater than  $1.23\text{ V}$ , connect a resistor divider network to the device as shown in Figure 15.  $V_{\text{INTH}}$ , the desired threshold voltage, can be expressed as

$$V_{\text{INTH}} = 1.23\text{ V}((R_1 + R_2)/(R_2))$$

The ADM6339 has a guaranteed input current of  $\pm 0.1\text{ }\mu\text{A}$  on its  $1.23\text{ V}$  adjustable input. Resistor values up to  $100\text{ k}\Omega$  can be used for  $R_2$  with  $<1\%$  error.

Figure 15. Setting the  $1.23\text{ V}$  Adjustable Monitor

The same approach is taken when using the  $0.62\text{ V}$  (typical) adjustable threshold input. Use the following equation to solve for the values of  $R_1$  and  $R_2$ :

$$V_{\text{INTH}} = 0.62\text{ V}((R_1 + R_2)/(R_2))$$

The  $0.62\text{ V}$  (typical) adjustable threshold input offers high threshold accuracy of  $\pm 0.8\%$ .

When monitoring a voltage more negative than  $-0.5\text{ V}$ , a scheme similar to that previously described in the Monitoring Negative Voltages  $< -5.0\text{ V}$  section is used. For an input monitor current error of  $< 1\%$ , the resistor network current should be  $\geq 500\ \mu\text{A}$  (for  $I_{IN4} = 5\ \mu\text{A}$  maximum). Calculate  $R_1$  based on the desired  $V_{INTH}$  reset threshold voltage, using the following equation:

$$R_1 = R_2((V_{INTH}/V_{TH}) - 1)$$

where  $V_{INTH}$  is the desired threshold voltage and  $V_{TH}$  is the internal threshold voltage,  $-0.487\text{ V}$  (typical).

### RESET OUTPUT CONFIGURATION

The  $\overline{\text{RESET}}$  output asserts low if a monitored  $\text{IN}_x$  voltage drops below its voltage threshold (or goes above its associated threshold in the case of the  $-0.5\text{ V}$  and  $-5.0\text{ V}$  input options). After all voltages exceed their associated threshold level, the reset signal remains low for the reset timeout period,  $t_{RP}$  (200 ms typical).

Figure 16. ADM6339  $\overline{\text{RESET}}$  Timing

$\overline{\text{RESET}}$  is open drain with a weak internal pull-up to  $\text{IN}_2$  of  $10\ \mu\text{A}$  (typical). Many applications that interface with other logic devices do not require an external pull-up resistor. However, if an external pull-up resistor is required and it is connected to a voltage ranging from  $0\text{ V}$  to  $5.5\text{ V}$ , the resistor overdrives the internal pull-up. Reverse current flow from the external pull-up voltage to  $\text{IN}_2$  is prevented by the internal circuitry.
