

**THE DATASHEET OF
AP3041MTR-G1**

Description

The AP3041 is a current mode high voltage low-side channel MOSFET controller, which is ideal for boost regulators. It contains all the features needed to implement single-ended primary topology DC/DC converters.

The input voltage of AP3041 ranges from 5V to 27V. Its operation frequency is adjustable from 100kHz to 1MHz.

The AP3041 has UVLO (Under Voltage Lock Out) circuit. It uses two external resistors to set the UVLO voltage. The AP3041 also has an over output voltage protection to limit the output voltage. The OVP voltage can be set through external resistors. If the output voltage is higher than the OVP high threshold point, it will disable the driver and the system is latched up. The output short circuit protection as well as LED low side short to ground detection function can be applied in system.

The AP3041 has other protection functions, such as LED short protection, LED high side short to ground protection, diode short protection, over current protection, over temperature protection and so on.

The AP3041 is available in SOIC-16 package.

Features

- Input Voltage Range: 5V to 27V
- 1A Peak and 10V MOSFET Gate Driver
- 20ns Quick MOSFET Gate Driver
- Duty Cycle Limit of 90%
- Programmable UVLO
- PWM Dimming Control
- Programmable Over Voltage Protection
- LED Open Protection
- LED Short Circuit Protection
- Diode Short Circuit Protection
- Output Short Circuit Protection
- LED Low-Side Short to Ground Detection
- OV Pin Under Voltage Protection
- Over Current Protection
- Programmable Slope Compensation
- Adjustable Soft-Start
- Adjustable Protection Delay
- Fault Status Indication
- Adjustable Operation Frequency from 100kHz to 1MHz
- Over Temperature Protection
- **Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)**
- **Halogen and Antimony Free. "Green" Device (Note 3)**

Notes: 1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.
 2. See <https://www.diodes.com/quality/lead-free/> for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

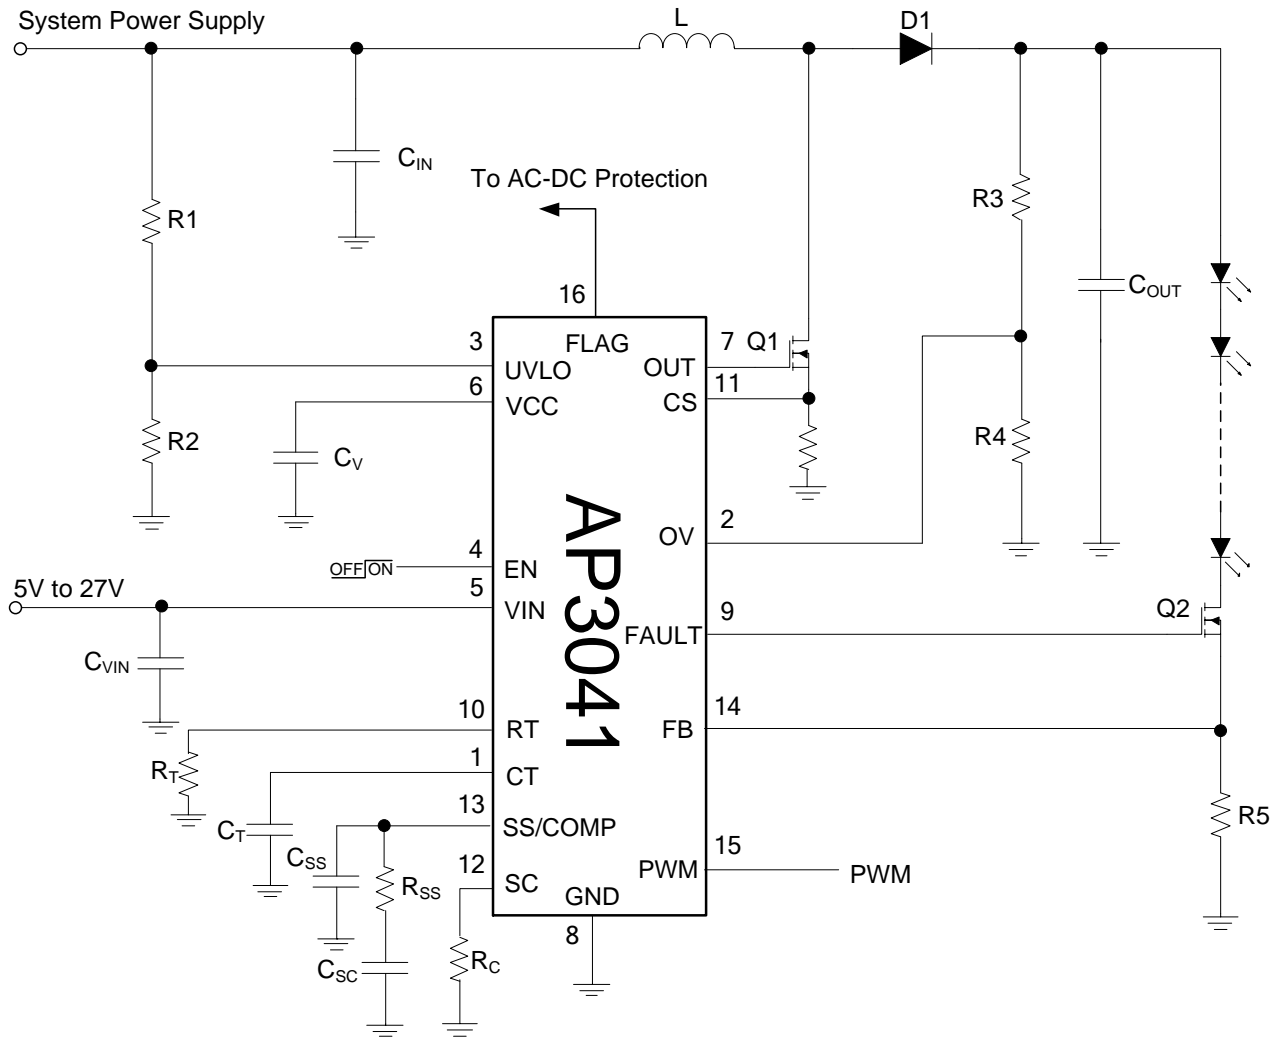

Pin Assignments

Applications

- LED Lighting
- LED TV
- LCD Display Modules

Typical Applications Circuit

Pin Descriptions

Pin Number	Pin Name	Function
1	CT	Capacitor Setting Shut Down Delay Time
2	OV	Over Output Voltage Protection Pin
3	UVLO	Two resistors connected from this pin to GND and the power supply respectively is used to set start-up and shutdown level.
4	EN	Enable Pin
5	VIN	Input supply pin. This pin must be locally bypassed.
6	VCC	This pin should be bypassed to GND with a ceramic capacitor.
7	OUT	Connect this pin to the gate of external MOSFET, the gate driver has 1A peak current capability.
8	GND	Ground
9	FAULT	This pin can be used to drive the external MOSFET. The logic of the driver signal is controlled by that of PWM pin and the signal phase of them is the same. This pin is pulled to ground under fault condition of OVP, UVLO, OTP, diode short circuit and LED short circuit.
10	RT	An external resistor connected from this pin to GND is used to set the operating frequency.
11	CS	Sense switch current pin, which is used for current mode control and for current limit. The current limit voltage is 500mV.
12	SC	Slope compensation for current sense. A resistor between SC and GND will program the slope compensation.
13	SS/COMP	An external soft-start time capacitor is placed from this pin to GND and is charged by an internal 20 μ A current source to control regulator soft-start time. Compensation pin. This pin is the output of the internal error amplifier.
14	FB	Voltage feedback pin. The reference voltage is 500mV.
15	PWM	This pin can be connected to current matched chip and receives error signal used to shut down the system.
16	FLAG	Fault condition output pin. When the output is in short circuit condition, the FLAG outputs logic low to shut down the power path. Please refer to the application circuit.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
