

**THE DATASHEET OF  
ADR435ARMZ-REEL7**

### FEATURES

Low noise (0.1 Hz to 10.0 Hz): 3.5  $\mu\text{V}$  p-p at 2.500 V output

No external capacitor required

Low temperature coefficient

A grade: 10 ppm/ $^{\circ}\text{C}$  maximum

B grade: 3 ppm/ $^{\circ}\text{C}$  maximum

Load regulation: 15 ppm/mA

Line regulation: 20 ppm/V

Wide operating range

**ADR430:** 4.1 V to 18 V

**ADR431:** 4.5 V to 18 V

**ADR433:** 5.0 V to 18 V

**ADR434:** 6.1 V to 18 V

**ADR435:** 7.0 V to 18 V

High output source and sink current: 30 mA and  $-20$  mA

Wide temperature range:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

### APPLICATIONS

Precision data acquisition systems

High resolution data converters

Medical instruments

Industrial process control systems

Optical control circuits

Precision instruments

### GENERAL DESCRIPTION

The [ADR430/ADR431/ADR433/ADR434/ADR435](#)<sup>1</sup> series is a family of XFET<sup>®</sup> voltage references featuring low noise, high accuracy, and low temperature drift performance. Using Analog Devices, Inc., temperature drift curvature correction and extra implanted junction FET (XFET) technology, voltage change vs. temperature nonlinearity in the [ADR430/ADR431/ADR433/ADR434/ADR435](#) is minimized.

The XFET references operate at lower current (800  $\mu\text{A}$ ) and lower supply voltage headroom (2 V) than buried Zener references. Buried Zener references require more than 5 V of headroom for operation. The [ADR430/ADR431/ADR433/ADR434/ADR435](#) XFET references are low noise solutions for 5 V systems.

The [ADR430/ADR431/ADR433/ADR434/ADR435](#) family has the capability to source up to 30 mA of output current and sink up to  $-20$  mA. It also comes with a trim terminal to adjust the output voltage over a  $\pm 0.5\%$  range without compromising performance.

<sup>1</sup> Protected by U.S. Patent Number 5,838,192.

#### Rev. N

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties that may result from its use. Specifications subject to change without notice. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices. Trademarks and registered trademarks are the property of their respective owners.

#### Document Feedback

### PIN CONFIGURATIONS

#### NOTES

1. NIC = NOT INTERNALLY CONNECTED. THIS PIN IS NOT CONNECTED INTERNALLY.
2. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.

04500-001

Figure 1. 8-Lead MSOP (RM-8)

#### NOTES

1. NIC = NOT INTERNALLY CONNECTED. THIS PIN IS NOT CONNECTED INTERNALLY.
2. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.

04500-041

Figure 2. 8-Lead SOIC\_N (R-8)

The [ADR430/ADR431/ADR433/ADR434/ADR435](#) are available in 8-lead MSOP and 8-lead narrow SOIC packages. All versions are specified over the extended industrial temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

## SPECIFICATIONS

## ADR430 ELECTRICAL CHARACTERISTICS

$V_{IN} = 4.1 \text{ V to } 18 \text{ V}$ ,  $I_L = 0 \text{ mA}$ ,  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 2.

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit
OUTPUT VOLTAGE	$V_{OUT}$					
A Grade			2.045	2.048	2.051	V
B Grade			2.047	2.048	2.049	V
INITIAL ACCURACY <sup>1</sup>	$V_{OERR}$					
A Grade					±3	mV
					±0.15	%
B Grade					±1	mV
					±0.05	%
TEMPERATURE COEFFICIENT	$TCV_{OUT}$					
A Grade		$-40^\circ\text{C} < T_A < +125^\circ\text{C}$		2	10	ppm/°C
B Grade		$-40^\circ\text{C} < T_A < +125^\circ\text{C}$		1	3	ppm/°C
LINE REGULATION	$\Delta V_{OUT}/\Delta V_{IN}$	$V_{IN} = 4.1 \text{ V to } 18 \text{ V}$ , $-40^\circ\text{C} < T_A < +125^\circ\text{C}$		5	20	ppm/V
LOAD REGULATION	$\Delta V_{OUT}/\Delta I_L$	$I_L = 0 \text{ mA to } 10 \text{ mA}$ , $V_{IN} = 5.0 \text{ V}$ , $-40^\circ\text{C} < T_A < +125^\circ\text{C}$ $I_L = -10 \text{ mA to } 0 \text{ mA}$ , $V_{IN} = 5.0 \text{ V}$ , $-40^\circ\text{C} < T_A < +125^\circ\text{C}$			15	ppm/mA
					15	ppm/mA
OUTPUT CURRENT CAPACITY	$I_L$					
Sourcing				30		mA
Sinking				-20		mA
QUIESCENT CURRENT	$I_{IN}$	No load, $-40^\circ\text{C} < T_A < +125^\circ\text{C}$		560	800	µA
VOLTAGE NOISE	$e_N \text{ p-p}$	0.1 Hz to 10.0 Hz		3.5		µV p-p
VOLTAGE NOISE DENSITY	$e_N$	1 kHz		60		nV/√Hz
TURN-ON SETTLING TIME	$t_R$	$C_L = 0 \text{ µF}$		10		µs
LONG-TERM STABILITY <sup>2</sup>	$\Delta V_{OUT}$	1000 hours		40		ppm
OUTPUT VOLTAGE HYSTERESIS	$V_{OUT\_HYS}$			20		ppm
RIPPLE REJECTION RATIO	RRR	$f_{IN} = 1 \text{ kHz}$		-70		dB
SHORT CIRCUIT TO GND	$I_{SC}$			40		mA
SUPPLY VOLTAGE OPERATING RANGE	$V_{IN}$		4.1		18	V
SUPPLY VOLTAGE HEADROOM	$V_{IN} - V_{OUT}$		2			V
TRIM RANGE			-5		+5	%

<sup>1</sup> Initial accuracy does not include shift due to solder heat effect.

<sup>2</sup> The long-term stability specification is noncumulative. The drift in subsequent 1000 hour periods is significantly lower than in the first 1000 hour period.

**ADR431 ELECTRICAL CHARACTERISTICS**

$V_{IN} = 4.5\text{ V to }18\text{ V}$ ,  $I_L = 0\text{ mA}$ ,  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

<sup>2</sup> The long-term stability specification is noncumulative. The drift in subsequent 1000 hour periods is significantly lower than in the first 1000 hour period.

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 7.

Parameter	Rating
Supply Voltage	20 V
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Operating Temperature Range	$-40^\circ\text{C}$ to $+125^\circ\text{C}$
Junction Temperature Range	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Lead Temperature, Soldering (60 sec)	$300^\circ\text{C}$

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 8. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
8-Lead SOIC_N (R)	130	43	$^\circ\text{C}/\text{W}$

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 9. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	DNC	Do Not Connect. Do not connect to this pin.
2	V <sub>IN</sub>	Input Voltage Connection.
3	NIC	Not Internally Connected. This pin is not connected internally.
4	GND	Ground.
5	TRIM	Output Voltage Trim.
6	V <sub>OUT</sub>	Output Voltage.
7	COMP	Compensation Input. Connect a series resistor and capacitor network from COMP to V <sub>OUT</sub> to reduce overall noise.
8	DNC	Do Not Connect. Do not connect to this pin.

### TYPICAL PERFORMANCE CHARACTERISTICS

Default conditions:  $V_{IN} = 7\text{ V}$ ,  $T_A = 25^\circ\text{C}$ ,  $C_{IN} = C_{OUT} = 0.1\ \mu\text{F}$ , unless otherwise noted.

### THEORY OF OPERATION

The [ADR430/ADR431/ADR433/ADR434/ADR435](#) series of references uses a reference generation technique known as XFET. This technique yields a reference with low supply current, optimal thermal hysteresis, and exceptionally low noise. The core of the XFET reference consists of two junction field effect transistors (JFETs), one of which has an extra channel implant to raise its pinch off voltage. The two JFETs run at the same drain current, and the difference in pinch off voltage is amplified to form a highly stable voltage reference.

The intrinsic reference voltage is around 0.5 V with a negative temperature coefficient of about -120 ppm/°C. This slope is essentially constant to the dielectric constant of silicon and can be compensated closely by adding a correction term generated in the same fashion as the proportional to absolute temperature (PTAT) term used to compensate band gap references. The primary advantage of an XFET reference is its correction term, which is ~30 times lower and requires less correction than that of a band gap reference. Because most of the noise of a band gap reference comes from the temperature compensation circuitry, the XFET results in much lower noise.

Figure 31 shows the basic topology of the [ADR430/ADR431/ADR433/ADR434/ADR435](#) series. The temperature correction term is provided by a current source with a value designed to be PTAT. The general equation is

$$V_{OUT} = G (\Delta V_P - R1 \times I_{PTAT}) \tag{1}$$

where:

G is the gain of the reciprocal of the divider ratio.  
 $\Delta V_P$  is the difference in pinch-off voltage between the two JFETs.  
 R1 is a resistor, as shown in Figure 31.  
 $I_{PTAT}$  is the positive temperature coefficient correction current.

The [ADR430/ADR431/ADR433/ADR434/ADR435](#) devices are created by on-chip adjustment of R2 and R3 to achieve 2.048 V to 5.000 V at the reference output.

Figure 31. Simplified Schematic Device Power Dissipation Considerations

The [ADR430/ADR431/ADR433/ADR434/ADR435](#) family of references is guaranteed to deliver load currents up to 10 mA with an input voltage that ranges from 4.1 V to 18 V.

When these devices are used in applications at higher currents, use the following equation to account for the temperature effects due to the power dissipation increases:

$$T_J = P_D \times \theta_{JA} + T_A \tag{2}$$

where:

$T_J$  and  $T_A$  are the junction and ambient temperatures, respectively.  
 $P_D$  is the device power dissipation.  
 $\theta_{JA}$  is the device package junction to ambient thermal resistance.

### BASIC VOLTAGE REFERENCE CONNECTIONS

Voltage references, in general, require a bypass capacitor connected from  $V_{OUT}$  to ground. The circuit in Figure 32 shows the basic configuration for the [ADR430/ADR431/ADR433/ADR434/ADR435](#) family of references. Other than a 0.1  $\mu F$  capacitor at the output to help improve noise suppression, a large output capacitor at the output is not required for circuit stability.

 2. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.

04500-044

Figure 32. Basic Voltage Reference Configuration

### NOISE PERFORMANCE

The noise generated by the [ADR430, ADR431, and ADR433](#) family of references is typically less than or equal to 3.75  $\mu V$  p-p over the 0.1 Hz to 10.0 Hz band for. Figure 24 shows the 0.1 Hz to 10.0 Hz noise of the [ADR431](#), which is only 3.5  $\mu V$  p-p. The noise measurement is made with a band-pass filter composed of a two-pole, high-pass filter with a corner frequency at 0.1 Hz and a two-pole, low-pass filter with a corner frequency at 10.0 Hz.

### HIGH FREQUENCY NOISE

The total noise generated by the [ADR430/ADR431/ADR433/ADR434/ADR435](#) family of references is composed of the reference noise and the op amp noise. Figure 33 shows the wideband noise from 10 Hz to 25 kHz. An internal node of the op amp is available on Pin 7, and by overcompensating the op amp, the overall noise can be reduced.

Consider that, in a closed-loop configuration, the effective output impedance of an op amp is as follows:

$$R_O = \frac{r_o}{1 + A_{VO}\beta} \tag{3}$$

where:

$R_O$  is the apparent output impedance.  
 $r_o$  is the output resistance of the op amp.

$A_{VO}$  is the open-loop gain at the frequency of interest.  
 $\beta$  is the feedback factor.

Equation 3 shows that the apparent output impedance is approximately reduced by the excess loop gain; therefore, as the frequency increases, the excess loop gain decreases, and the apparent output impedance increases. A passive element whose impedance increases as its frequency increases is an inductor. When a capacitor is added to the output of an op amp or a reference, it forms a tuned circuit that resonates at a certain frequency and results in gain peaking. Gain peaking can be observed by using a model of an op amp with a single-pole response and some pure resistance in series with the output. Changing capacitive loads results in peaking at different frequencies. For most normal op amp applications with low capacitive loading (<100 pF), this effect is usually not observed.

However, references are used increasingly to drive the reference input of an analog-to-digital (ADC) that may present a dynamic, switching capacitive load. Large capacitors, in the microfarad range, reduce the change in reference voltage to less than one-half LSB. Figure 33 shows the ADR431 noise spectrum with various capacitive values to 50  $\mu$ F. With no capacitive load, the noise spectrum is relatively flat at approximately 60 nV/ $\sqrt$ Hz to 70 nV/ $\sqrt$ Hz. With various values of capacitive loading, the predicted noise peaking becomes evident.

Figure 33. Noise Density vs. Frequency at Various Capacitive Loads

The op amp within the ADR430/ADR431/ADR433/ADR434/ADR435 family uses the classic resistor and capacitor (RC) compensation technique. Monolithic capacitors in an IC are limited to tens of picofarads. With very large external capacitive

loads, such as 50  $\mu$ F, it is necessary to overcompensate the op amp. The internal compensation node is available on Pin 7, and an external series RC network can be added between Pin 7 and the output, Pin 6, as shown in Figure 34.

- NOTES  
 1. NIC = NOT INTERNALLY CONNECTED. THIS PIN IS NOT CONNECTED INTERNALLY.  
 2. DNC = DO NOT CONNECT. DO NOT CONNECT TO THIS PIN.

Figure 34. Compensated Reference

The 82 k $\Omega$  resistor and 10 nF capacitor eliminate noise peaking (see Figure 35). Leave the COMP pin unconnected if unused.

Figure 35. Noise with Compensation Network

### TURN-ON SETTLING TIME

Upon application of power (cold start), the time required for the output voltage to reach its final value within a specified error band is defined as the turn-on settling time. Two components normally associated with this settling time are the time for the active circuits to settle and the time for the thermal gradients on the chip to stabilize. Figure 19 and Figure 20 show the turn-on settling time for the ADR431.

Because the amplifier senses the load voltage, the operational amplifier loop control forces the output to compensate for the wiring error and to produce the correct voltage at the load.

Figure 39. Advantage of Kelvin Connection

**DUAL POLARITY REFERENCES**

Dual polarity references can easily be made with an operational amplifier and a pair of resistors. To avoid defeating the accuracy obtained by the ADR430/ADR431/ADR433/ADR434/ADR435, it is imperative to match the resistance tolerance as well as the temperature coefficient of all the components.

Figure 40. 5 V and -5 V References Using ADR435

Figure 41. 2.5 V and -2.5 V References Using ADR435

**PROGRAMMABLE CURRENT SOURCE**

Together with a digital potentiometer and a Howland current pump, the ADR435 forms the reference source for a programmable current as

$$I_L = \left( \frac{R2_A + R2_B}{R1} \right) \times V_W \tag{4}$$

and

$$V_W = \frac{D}{2^N} \times V_{REF} \tag{5}$$

where:

$V_W$  is the voltage at Terminal W.

$D$  is the decimal equivalent of the input code.

$N$  is the number of bits.

In addition,  $R1'$  and  $R2'$  must be equal to  $R1$  and  $(R2_A + R2_B)$ , respectively. In theory,  $R2_B$  can be made as small as needed to achieve the necessary current within the A2 output current driving capability. In this example, the OP2177 can deliver a maximum current of 10 mA. Because the current pump employs both positive and negative feedback, the C1 and C2 capacitors are needed to ensure that the negative feedback prevails and, therefore, avoids oscillation. This circuit also allows bidirectional current flow if the A and B inputs of the digital potentiometer are supplied with the dual polarity references, as shown in Figure 42.

Figure 42. Programmable Current Source

**PRECISION BOOSTED OUTPUT REGULATOR**

A precision voltage output with boosted current capability can be achieved with the circuit shown in Figure 45. In this circuit, U2 forces  $V_O$  to be equal to  $V_{REF}$  by regulating gate voltage of N1. Therefore, the load current is supplied by  $V_{IN}$ . In this configuration, a 50 mA load is achievable at a  $V_{IN}$  of 5 V. Moderate heat is generated on the MOSFET, and higher current is achieved with a replacement of the larger device. In addition, for a heavy capacitive load with step input, add a buffer at the output to enhance the transient response.
