

**THE DATASHEET OF
TMS320C6416TBZLZ1**

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

- **Highest-Performance Fixed-Point DSPs**
 - 1.67-/1.39-/1.17-/1-ns Instruction Cycle
 - 600-/720-/850-MHz, 1-GHz Clock Rate
 - Eight 32-Bit Instructions/Cycle
 - Twenty-Eight Operations/Cycle
 - 4800, 5760, 6800, 8000 MIPS
 - Fully Software-Compatible With C62x™
 - C6414/15/16 Devices Pin-Compatible
 - Extended Temperature Devices Available
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x™ DSP Core**
 - Eight Highly Independent Functional Units With VelociTI.2™ Extensions:
 - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
 - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
 - Non-Aligned Load-Store Architecture
 - 64 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
- **Instruction Set Features**
 - Byte-Addressable (8-/16-/32-/64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - VelociTI.2™ Increased Orthogonality
- **VCP [C6416T Only]**
 - Supports Over 833 7.95-Kbps AMR
 - Programmable Code Parameters
- **TCP [C6416T Only]**
 - Supports up to 10 2-Mbps or 60 384-Kbps 3GPP (6 Iterations)
 - Programmable Turbo Code and Decoding Parameters
- **L1/L2 Memory Architecture**
 - 128K-Bit (16K-Byte) L1P Program Cache (Direct Mapped)
 - 128K-Bit (16K-Byte) L1D Data Cache (2-Way Set-Associative)
 - 8M-Bit (1024K-Byte) L2 Unified Mapped RAM/Cache (Flexible Allocation)
- **Two External Memory Interfaces (EMIFs)**
 - One 64-Bit (EMIFA), One 16-Bit (EMIFB)
 - Glueless Interface to Asynchronous Memories (SRAM and EPROM) and Synchronous Memories (SDRAM, SBSRAM, ZBT SRAM, and FIFO)
 - 1280M-Byte Total Addressable External Memory Space
- **Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)**
- **Host-Port Interface (HPI)**
 - User-Configurable Bus Width (32-/16-Bit)
- **32-Bit/33-MHz, 3.3-V PCI Master/Slave Interface Conforms to PCI Specification 2.2 [C6415T/C6416T]**
 - Three PCI Bus Address Registers:
 - Prefetchable Memory
 - Non-Prefetchable Memory I/O
 - Four-Wire Serial EEPROM Interface
 - PCI Interrupt Request Under DSP Program Control
 - DSP Interrupt Via PCI I/O Cycle
- **Three Multichannel Buffered Serial Ports**
 - Direct Interface to T1/E1, MVIP, SCSA Framers
 - Up to 256 Channels Each
 - ST-Bus-Switching-, AC97-Compatible
 - Serial Peripheral Interface (SPI) Compatible (Motorola™)
- **Three 32-Bit General-Purpose Timers**
- **UTOPIA [C6415T/C6416T]**
 - UTOPIA Level 2 Slave ATM Controller
 - 8-Bit Transmit and Receive Operations up to 50 MHz per Direction
 - User-Defined Cell Format up to 64 Bytes
- **Sixteen General-Purpose I/O (GPIO) Pins**
- **Flexible PLL Clock Generator**
- **IEEE-1149.1 (JTAG†) Boundary-Scan-Compatible**
- **532-Pin Ball Grid Array (BGA) Package (GLZ/ZLZ/CLZ Suffixes), 0.8-mm Ball Pitch**
- **0.09-μm/7-Level Cu Metal Process (CMOS)**
- **3.3-V I/Os, 1.1-V Internal (600 MHz)**
- **3.3-V I/Os, 1.2-V Internal (720/850 MHz, 1 GHz)**

REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPRS226L device-specific data sheet to make it an SPRS226M.

Scope: Applicable updates to the C64x device family, specifically relating to the C6414T/C6415T/C6416T devices, have been incorporated.

description

The TMS320C64x™ DSPs (including the TMS320C6414T, TMS320C6415T, and TMS320C6416T devices†) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The TMS320C64x™ (C64x™) device is based on the second-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture (VelociTI.2™) developed by Texas Instruments (TI), making these DSPs an excellent choice for wireless infrastructure applications. The C64x™ is a code-compatible member of the C6000™ DSP platform.

With performance of up to 8000 million instructions per second (MIPS) at a clock rate of 1 GHz, the C64x devices offer cost-effective solutions to high-performance DSP programming challenges. The C64x DSPs possess the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x™ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs)—with VelociTI.2™ extensions. The VelociTI.2™ extensions in the eight functional units include new instructions to accelerate the performance in key applications and extend the parallelism of the VelociTI™ architecture. The C64x can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 4000 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 8000 MMACS. The C64x DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000™ DSP platform devices.

The C6416T device has two high-performance embedded coprocessors [Viterbi Decoder Coprocessor (VCP) and Turbo Decoder Coprocessor (TCP)] that significantly speed up channel-decoding operations on-chip. The VCP operating at CPU clock divided-by-4 can decode over 833 7.95-Kbps adaptive multi-rate (AMR) [K = 9, R = 1/3] voice channels. The VCP supports constraint lengths K = 5, 6, 7, 8, and 9, rates R = 1/2, 1/3, and 1/4, and flexible polynomials, while generating hard decisions or soft decisions. The TCP operating at CPU clock divided-by-2 can decode up to sixty 384-Kbps or ten 2-Mbps turbo encoded channels (assuming 6 iterations). The TCP implements the max*log-map algorithm and is designed to support all polynomials and rates required by Third-Generation Partnership Projects (3GPP and 3GPP2), with fully programmable frame length and turbo interleaver. Decoding parameters such as the number of iterations and stopping criteria are also programmable. Communications between the VCP/TCP and the CPU are carried out through the EDMA controller.

The C64x uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 128-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 128-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of an 8-Mbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory or combinations of cache (up to 256K bytes) and mapped memory. The peripheral set includes three multichannel buffered serial ports (McBSPs); an 8-bit Universal Test and Operations PHY Interface for Asynchronous Transfer Mode (ATM) Slave [UTOPIA Slave] port [C6415T/C6416T only]; three 32-bit general-purpose timers; a user-configurable 16-bit or 32-bit host-port interface (HPI16/HPI32); a peripheral component interconnect (PCI) [C6415T/C6416T only]; a general-purpose input/output port (GPIO) with 16 GPIO pins; and two glueless external memory interfaces (64-bit EMIFA and 16-bit EMIFB‡), both of which are capable of interfacing to synchronous and asynchronous memories and peripherals.

The C64x has a complete set of development tools which includes: an advanced C compiler with C64x-specific enhancements, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

† Throughout the remainder of this document, the TMS320C6414T, TMS320C6415T, and TMS320C6416T shall be referred to as TMS320C64x or C64x where generic, and where specific, their individual full device part numbers will be used or abbreviated as C6414T, C6415T, or C6416T.

‡ These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

[†] Note: The extended temperature devices' (A-600, A-720, and A-850) Electrical Characteristics and AC Timings are the same as those for commercial temperature devices (e.g., -600, -720, and -850).

device compatibility

The C64x™ generation of devices has a diverse and powerful set of peripherals. The common peripheral set and pin-compatibility that the C6414T, C6415T, and C6416T devices offer lead to easier system designs and faster time to market. Table 2 identifies the peripherals and coprocessors that are available on the C6414T, C6415T, and C6416T devices.

The C6414T, C6415T, and C6416T devices are pin-for-pin compatible, provided the following conditions are met:

- All devices are using the same peripherals.
The C6414T is pin-for-pin compatible with the C6415T/C6416T when the PCI and UTOPIA peripherals on the C6415T/C6416T are disabled.
The C6415T is pin-for-pin compatible with the C6416T when they are in the same peripheral selection mode. [For more information on peripheral selection, see the Device Configurations section of this data sheet.]
- The BEA[9:7] pins are properly pulled up/down.
[For more details on the device-specific BEA[9:7] pin configurations, see the Terminal Functions table of this data sheet.]

Table 2. Peripherals and Coprocessors Available on the C6414T, C6415T, and C6416T Devices†‡

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

functional block and CPU (DSP core) diagram

† VCP and TCP decoder coprocessors are applicable to the C6416T device only.

‡ For the C6415T and C6416T devices, the UTOPIA peripheral is muxed with McBSP1, and the PCI peripheral is muxed with the HPI peripheral and the GPIO[15:9] port. For more details on the multiplexed pins of these peripherals, see the Device Configurations section of this data sheet.

CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIWs) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C64x CPUs from other VLIW architectures. The C64x™ VelociTI.2™ extensions add enhancements to the TMS320C62x™ DSP VelociTI™ architecture. These enhancements include:

- Register file enhancements
- Data path extensions
- Quad 8-bit and dual 16-bit extensions with data flow enhancements
- Additional functional unit hardware
- Increased orthogonality of the instruction set
- Additional instructions that reduce code size and increase register flexibility

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 32 32-bit registers for a total of 64 general-purpose registers. In addition to supporting the packed 16-bit and 32-/40-bit fixed-point data types found in the C62x™ VelociTI™ VLIW architecture, the C64x™ register files also support packed 8-bit data and 64-bit fixed-point data types. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional block and CPU (DSP core) diagram, and Figure 1]. The four functional units on each side of the CPU can freely share the 32 registers belonging to that side. Additionally, each side features a “data cross path”—a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. The C64x CPU pipelines data-cross-path accesses over multiple clock cycles. This allows the same register to be used as a data-cross-path operand by multiple functional units in the same execute packet. All functional units in the C64x CPU can access operands via the data cross path. Register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle. On the C64x CPU, a delay clock is introduced whenever an instruction attempts to read a register via a data cross path if that register was updated in the previous clock cycle.

In addition to the C62x™ DSP fixed-point instructions, the C64x™ DSP includes a comprehensive collection of quad 8-bit and dual 16-bit instruction set extensions. These VelociTI.2™ extensions allow the C64x CPU to operate directly on packed data to streamline data flow and increase instruction set efficiency.

Another key feature of the C64x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C64x .D units can load and store bytes (8 bits), half-words (16 bits), and words (32 bits) with a single instruction. And with the new data path extensions, the C64x .D unit can load and store doublewords (64 bits) with a single instruction. Furthermore, the non-aligned load and store instructions allow the .D units to access words and doublewords on any byte boundary. The C64x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 64 registers. Some registers, however, are singled out to support specific addressing modes or to hold the condition for conditional instructions (if the condition is not automatically “true”).

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

CPU (DSP core) description (continued)

The two .M functional units perform all multiplication operations. Each of the C64x .M units can perform two 16×16 -bit multiplies or four 8×8 -bit multiplies per clock cycle. The .M unit can also perform 16×32 -bit multiply operations, dual 16×16 -bit multiplies with add/subtract operations, and quad 8×8 -bit multiplies with add operations. In addition to standard multiplies, the C64x .M units include bit-count, rotate, Galois field multiplies, and bidirectional variable shift hardware.

The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle. The arithmetic and logical functions on the C64x CPU include single 32-bit, dual 16-bit, and quad 8-bit operations.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. A C64x™ DSP device enhancement now allows execute packets to cross fetch-packet boundaries. In the TMS320C62x™/TMS320C67x™ DSP devices, if an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. In the C64x™ DSP device, the execute boundary restrictions have been removed, thereby, eliminating all of the NOPs added to pad the fetch packet, and thus, decreasing the overall code size. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes, half-words, words, or doublewords. All load and store instructions are byte-, half-word-, word-, or doubleword-addressable.

For more details on the C64x CPU functional units enhancements, see the following documents:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189)

TMS320C64x Technical Overview (literature number SPRU395)

For more detailed information on the device compatibility, similarities/differences, and migration from the TMS320C6414/15/16 devices to the TMS320C6414T/15T/16T devices, see the following document:

Migrating From TMS320C6416/15/14 to TMS320C6416T/15T/14T application report (literature number SPRA981).

memory map summary

Table 3 shows the memory map address ranges of the TMS320C64x device. Internal memory is always located at address 0 and can be used as both program and data memory. The external memory address ranges in the C64x device begin at the hex address locations 0x6000 0000 for EMIFB and 0x8000 0000 for EMIFA.

[†] For the C6414T device, these memory address locations are reserved. The C6414T device does *not* support the UTOPIA and PCI peripherals.

[‡] Only the C6416T device supports the VCP/TCP Coprocessors. For the C6414T and C6415T devices, these memory address locations are reserved.

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

L2 architecture expanded

Figure 2 shows the detail of the L2 architecture on the TMS320C6414T, TMS320C6415T, and TMS320C6416T devices. For more information on the L2MODE bits, see the cache configuration (CCFG) register bit field descriptions in the *TMS320C64x Two-Level Internal Memory Reference Guide* (literature number SPRU610).

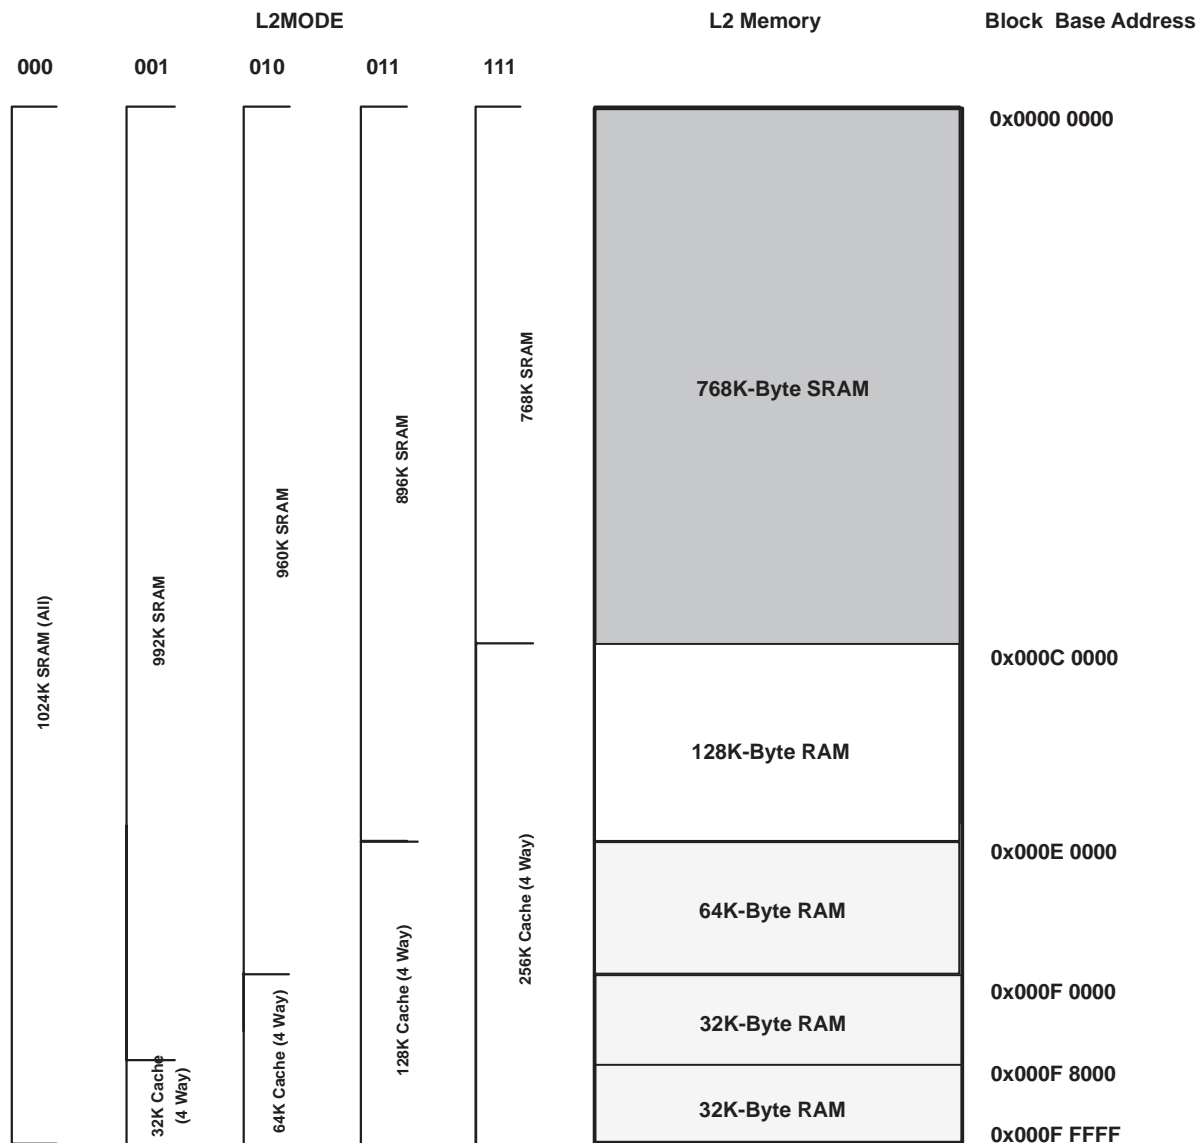

Figure 2. TMS320C6414T/C6415T/C6416T L2 Architecture Memory Configuration

peripheral register descriptions

Table 4 through Table 23 identify the peripheral registers for the C6414T, C6415T, and C6416T devices by their register names, acronyms, and hex address or hex address range. For more detailed information on the register contents, bit names and their descriptions, see the specific peripheral reference guide listed in the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190).

Table 4. EMIFA Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|-----------------------|---------|--|
| 0180 0000 | GBLCTL | EMIFA global control |
| 0180 0004 | CECTL1 | EMIFA CE1 space control |
| 0180 0008 | CECTL0 | EMIFA CE0 space control |
| 0180 000C | – | Reserved |
| 0180 0010 | CECTL2 | EMIFA CE2 space control |

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

EDMA channel synchronization events

The C64x EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. Table 24 lists the source of C64x EDMA synchronization events associated with each of the programmable EDMA channels. For the C64x device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ERL, ERH) even if the events are disabled by the EDMA event enable registers (EERL, EERH). The priority of each event can be specified independently in the transfer parameters stored in the EDMA parameter RAM. For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

EDMA channel synchronization events (continued)

Table 24. TMS320C64x EDMA Channel Synchronization Events†

| EDMA CHANNEL | EVENT NAME | EVENT DESCRIPTION |
|--------------|-----------------|--|

| 54 | GPINT14 | GPIO event 14 |
| 55 | GPINT15 | GPIO event 15 |
| 56–63 | – | None |

† In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

‡ The PCI and UTOPIA peripherals are not supported on the C6414T device; therefore, these EDMA synchronization events are reserved.

§ The VCP/TCP EDMA synchronization events are supported on the C6416T only. For the C6414T and C6415T devices, these events are reserved.

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

interrupt sources and interrupt selector

The C64x DSP core supports 16 prioritized interrupts, which are listed in Table 25. The highest-priority interrupt is INT_00 (dedicated to RESET) while the lowest-priority interrupt is INT_15. The first four interrupts (INT_00–INT_03) are non-maskable and fixed. The remaining interrupts (INT_04–INT_15) are maskable and default to the interrupt source specified in Table 25. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

interrupt sources and interrupt selector (continued)

Table 25. C64x DSP Interrupts

| CPU INTERRUPT NUMBER | INTERRUPT SELECTOR CONTROL REGISTER | SELECTOR VALUE (BINARY) | INTERRUPT EVENT | INTERRUPT SOURCE |
|----------------------|-------------------------------------|-------------------------|-----------------|---|
| INT_00† | – | – | RESET | |
| INT_01† | – | – | NMI | |
| INT_02† | – | – | Reserved | Reserved. Do not use. |
| INT_03† | – | – | Reserved | Reserved. Do not use. |
| INT_04‡ | MUXL[4:0] | 00100 | GPINT4/EXT_INT4 | GPIO interrupt 4/External interrupt pin 4 |
| INT_05‡ | MUXL[9:5] | 00101 | GPINT5/EXT_INT5 | GPIO interrupt 5/External interrupt pin 5 |
| INT_06‡ | MUXL[14:10] | 00110 | GPINT6/EXT_INT6 | GPIO interrupt 6/External interrupt pin 6 |
| INT_07‡ | MUXL[20:16] | 00111 | GPINT7/EXT_INT7 | GPIO interrupt 7/External interrupt pin 7 |
| INT_08‡ | MUXL[25:21] | 01000 | EDMA_INT | EDMA channel (0 through 63) interrupt |
| INT_09‡ | MUXL[30:26] | 01001 | EMU_DTDMA | EMU DTDMA |
| INT_10‡ | MUXH[4:0] | 00011 | SD_INTA | EMIFA SDRAM timer interrupt |
| INT_11‡ | MUXH[9:5] | 01010 | EMU_RTDXRX | EMU real-time data exchange (RTDX) receive |
| INT_12‡ | MUXH[14:10] | 01011 | EMU_RTDXTX | EMU RTDX transmit |
| INT_13‡ | MUXH[20:16] | 00000 | DSP_INT | HPI/PCI-to-DSP interrupt (PCI supported on C6415T and C6416T) |
| INT_14‡ | MUXH[25:21] | 00001 | TINT0 | Timer 0 interrupt |
| INT_15‡ | MUXH[30:26] | 00010 | TINT1 | Timer 1 interrupt |
| – | – | 01100 | XINT0 | McBSP0 transmit interrupt |
| – | – | 01101 | RINT0 | McBSP0 receive interrupt |
| – | – | 01110 | XINT1 | McBSP1 transmit interrupt |
| – | – | 01111 | RINT1 | McBSP1 receive interrupt |
| – | – | 10000 | GPINT0 | GPIO interrupt 0 |
| – | – | 10001 | XINT2 | McBSP2 transmit interrupt |
| – | – | 10010 | RINT2 | McBSP2 receive interrupt |
| – | – | 10011 | TINT2 | Timer 2 interrupt |
| – | – | 10100 | SD_INTB | EMIFB SDRAM timer interrupt |
| – | – | 10101 | Reserved | Reserved. Do not use. |
| – | – | 10110 | Reserved | Reserved. Do not use. |
| – | – | 10111 | UINT | UTOPIA interrupt (C6415T/C6416T only) |
| – | – | 11000 – 11101 | Reserved | Reserved. Do not use. |
| – | – | 11110 | VCPINT | VCP interrupt (C6416T only) |
| – | – | 11111 | TCPINT | TCP interrupt (C6416T only) |

† Interrupts INT_00 through INT_03 are non-maskable and fixed.

‡ Interrupts INT_04 through INT_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 25 shows the default interrupt sources for Interrupts INT_04 through INT_15. For more detailed information on interrupt sources and selection, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

signal groups description

† These pins are muxed with the GPIO port pins and by default these signals function as clocks (CLKOUT4 or CLKOUT6) or McBSP2 clock source (CLKS2). To use these muxed pins as GPIO signals, the appropriate GPIO register bits (GPxEN and GPxDIR) must be properly enabled and configured. For more details, see the Device Configurations section of this data sheet.

‡ These pins are GPIO pins that can also function as external interrupt sources (EXT_INT[7:4]). Default after reset is EXT_INTx or GPIO as input-only.

§ For the C6415T and C6416T devices, these GPIO pins are muxed with the PCI peripheral pins. By default, these signals are set up to no function with both the GPIO and PCI pin functions *disabled*. For more details on these muxed pins, see the Device Configurations section of this data sheet. For the C6414T device, the GPIO peripheral pins are *not* muxed; the C6414T device does *not* support the PCI peripheral.

Figure 3. CPU and Peripheral Signals

signal groups description (continued)

† These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

Figure 4. Peripheral Signals

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

signal groups description (continued)

† For the C6415T and C6416T devices, these HPI pins are muxed with the PCI peripheral. By default, these signals function as HPI. For more details on these muxed pins, see the Device Configurations section of this data sheet. For the C6414 device, these HPI pins are *not* muxed; the C6414T device does *not* support the PCI peripheral.

‡ For the C6415T and C6416T devices, these PCI pins (excluding PCBE0 and XSP_CS) are muxed with the HPI, McBSP2, or GPIO peripherals. By default, these signals function as HPI, McBSP2, and no function, respectively. For more details on these muxed pins, see the Device Configurations section of this data sheet. For the C6414T device, the HPI, McBSP2, and GPIO peripheral pins are *not* muxed; the C6414T device does *not* support the PCI peripheral.

§ For the C6414T device, these pins are "Reserved (leave unconnected, *do not* connect to power or ground)."

Figure 4. Peripheral Signals (Continued)

signal groups description (continued)

† For the C6415T and C6416T devices, these McBSP2 and McBSP1 pins are muxed with the PCI and UTOPIA peripherals, respectively. By default, these signals function as McBSP2 and McBSP1, respectively. For more details on these muxed pins, see the Device Configurations section of this data sheet.

For the C6414T device, these McBSP2 and McBSP1 peripheral pins are *not* muxed; the C6414T device does *not* support PCI and UTOPIA peripherals.

‡ The McBSP2 clock source pin (CLKS2, default) is muxed with the GP8 pin. To use this muxed pin as the GP8 signal, the appropriate GPIO register bits (GP8EN and GP8DIR) must be properly enabled and configured. For more details, see the Device Configurations section of this data sheet.

Figure 4. Peripheral Signals (Continued)

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

signal groups description (continued)

† For the C6415T and C6416T devices, these UTOPIA pins are muxed with the McBSP1 peripheral. By default, these signals function as McBSP1. For more details on these muxed pins, see the Device Configurations section of this data sheet.
For the C6414T device, these McBSP1 peripheral pins are *not* muxed; the C6414T does *not* support the UTOPIA peripheral.

Figure 4. Peripheral Signals (Continued)

DEVICE CONFIGURATIONS

The C6414T, C6415T, and C6416T device configurations are determined by external pullup/pulldown resistors on the following pins (all of which are latched during device reset):

- peripherals selection (C6415T and C6416T devices)
 - BEA11 (UTOPIA_EN)
 - PCI_EN (for C6415T or C6416T, see Table 27 footnotes)
 - MCBSP2_EN (for C6415T or C6416T, see Table 27 footnotes)

The C6414T device does *not* support the PCI and UTOPIA peripherals; for proper operation of the C6414T device, do *not* oppose the internal *pulldowns* (IPDs) on the BEA11, PCI_EN, and MCBSP2_EN pins. (For IPU/IPDs on pins, see the Terminal Functions table of this data sheet.)

- other device configurations (C64x)
 - BEA[20:13, 7]
 - HD5

peripherals selection

Some C6415T/C6416T peripherals share the same pins (internally muxed) and are mutually exclusive (i.e., HPI, general-purpose input/output pins GP[15:9], PCI and its internal EEPROM, McBSP1, McBSP2, and UTOPIA). The VCP/TCP coprocessors (C6416T only) and other C64x peripherals (i.e., the Timers, McBSP0, and the GP[8:0] pins), are always available.

- UTOPIA and McBSP1 peripherals

The UTOPIA_EN pin (BEA11) is latched at reset. For C6415T and C6416T devices, this pin selects whether the UTOPIA peripheral or McBSP1 peripheral is functionally enabled (see Table 26).

The C6414T device does *not* support the UTOPIA peripheral; for proper device operation, do *not* oppose the internal *pulldown* (IPD) on the BEA11 pin.

Table 26. UTOPIA_EN Peripheral Selection (McBSP1 and UTOPIA) (C6415T/C6416T Only)

| PERIPHERAL SELECTION UTOPIA_EN (BEA11) Pin [D16] | PERIPHERALS SELECTED | | DESCRIPTION |
|--|----------------------|--------|---|
| | UTOPIA | McBSP1 | |
| 0 | | √ | McBSP1 is enabled and UTOPIA is disabled [default]. This means all multiplexed McBSP1/UTOPIA pins function as McBSP1 and all other standalone UTOPIA pins are tied-off (Hi-Z). |
| 1 | √ | | UTOPIA is enabled and McBSP1 is disabled. This means all multiplexed McBSP1/UTOPIA pins now function as UTOPIA and all other standalone McBSP1 pins are tied-off (Hi-Z). |

- HPI, GP[15:9], PCI, EEPROM (internal to PCI), and McBSP2 peripherals

The PCI_EN and MCBSP2_EN pins are latched at reset. They determine specific peripheral selection for the C6415T and C6416T devices, summarized in Table 27.

The C6414T device does *not* support the PCI peripheral; for proper device operation, do *not* oppose the internal pulldowns (IPDs) on the PCI_EN and MCBSP2_EN pins.

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

DEVICE CONFIGURATIONS (CONTINUED)

Table 27. PCI_EN and MCBSP2_EN Peripheral Selection (HPI, GP[15:9], PCI, and McBSP2)

| PERIPHERAL SELECTION† | | PERIPHERALS SELECTED | | | | |
|-----------------------|------------------------|----------------------|----------|-----|-----------------------------|--------|
| PCI_EN Pin [AA4] | MCBSP2_EN Pin [AF3] | HPI | GP[15:9] | PCI | EEPROM (Internal to PCI) | McBSP2 |
| 0 | 0 | √ | √ | | | √ |
| 0 | 1 | √ | √ | | | √ |
| 1 | 0 | | | √ | √ | ‡ |
| 1 | 1 | | | √ | | √ |

† The PCI_EN pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.

The MCBSP2_EN pin *must* be driven valid at all times and the user *can* switch values throughout device operation.

‡ The only time McBSP2 is disabled is when both PCI_EN = 1 and MCBSP2_EN = 0. This configuration enables, at reset, the auto-initialization of the PCI peripheral through the PCI internal EEPROM [provided the PCI EEPROM Auto-Initialization pin (BEA13) is pulled up (EEAI = 1)]. The user can then enable the McBSP2 peripheral (disabling EEPROM) by dynamically changing MCBSP2_EN to a “1” after the device is initialized (out of reset).

- If the PCI is disabled (PCI_EN = 0), the HPI peripheral is enabled and GP[15:9] pins can be programmed as GPIO, provided the GPxEN and GPxDIR bits are properly configured. [Note: The PCI_EN pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.]

This means all multiplexed HPI/PCI pins function as HPI and all standalone PCI pins ($\overline{\text{PCBE0}}$ and XSP_CS) are tied-off (Hi-Z). Also, the multiplexed GPIO/PCI pins can be used as GPIO with the proper software configuration of the GPIO enable and direction registers (for more details, see Table 29).

- If the PCI is enabled (PCI_EN = 1), the HPI peripheral is disabled. [Note: The PCI_EN pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.]

This means all multiplexed HPI/PCI pins function as PCI. Also, the multiplexed GPIO/PCI pins function as PCI pins (for more details, see Table 29).

- The MCBSP2_EN pin, in combination with the PCI_EN pin, controls the selection of the McBSP2 peripheral and the PCI internal EEPROM (for more details, see Table 27 and its footnotes). [Note: The MCBSP2_EN pin *must* be driven valid at all times and the user *can* switch values throughout device operation.]

other device configurations

Table 28 describes the C6414T, C6415T, and C6416T devices configuration pins, which are set up via external pullup/pulldown resistors through the specified EMIFB address bus pins (BEA[20:13, 11, 9:7]) and the HD5 pin. For more details on these device configuration pins, see the Terminal Functions table and the Debugging Considerations section.

DEVICE CONFIGURATIONS (CONTINUED)

Table 28. Device Configuration Pins (BEA[20:13, 9:7], HD5, and BEA11)

| CONFIGURATION PIN | NO. | FUNCTIONAL DESCRIPTION |
|-------------------|------------|---|
| BEA20 | E16 | Device Endian mode (LEND) 0 – System operates in Big Endian mode 1 – System operates in Little Endian mode (default) |
| BEA[19:18] | [D18, C18] | Bootmode [1:0] 00 – No boot 01 – HPI boot 10 – EMIFB 8-bit ROM boot with default timings (default mode) 11 – Reserved |
| BEA[17:16] | [B18, A18] | EMIFA input clock select Clock mode select for EMIFA (AECLKIN_SEL[1:0]) 00 – AECLKIN (default mode) 01 – CPU/4 Clock Rate 10 – CPU/6 Clock Rate 11 – Reserved |
| BEA[15:14] | [D17, C17] | EMIFB input clock select Clock mode select for EMIFB (BECLKIN_SEL[1:0]) 00 – BECLKIN (default mode) 01 – CPU/4 Clock Rate 10 – CPU/6 Clock Rate 11 – Reserved |
| BEA13 | B17 | PCI EEPROM Auto-Initialization (EEAI) [C6415T and C6416T devices only] [The C6414T device does <i>not</i> support the PCI peripheral; for proper device operation, do not oppose the internal pulldown (IPD) on the BEA13 pin.] PCI auto-initialization via external EEPROM 0 – PCI auto-initialization through EEPROM is disabled; the PCI peripheral uses the specified PCI default values (default). 1 – PCI auto-initialization through EEPROM is enabled; the PCI peripheral is configured through EEPROM provided the PCI peripheral pin is enabled (PCI_EN = 1) and the McBSP2 peripheral pin is disabled (MCBSP2_EN = 0). Note: If the PCI peripheral is disabled (PCI_EN pin = 0), this pin must not be pulled up. For more information on the PCI EEPROM default values, see the <i>TMS320C6000 DSP Peripheral Component Interconnect (PCI) Reference Guide</i> (literature number SPRU581). |
| BEA11 | D16 | UTOPIA Enable (UTOPIA_EN) [C6415T and C6416T devices only] [The C6414T device does <i>not</i> support the UTOPIA peripheral; for proper device operation, do not oppose the internal pulldown (IPD) on the BEA11 pin.] UTOPIA peripheral enable (functional) 0 – UTOPIA peripheral disabled (McBSP1 functions are enabled). [default] This means all multiplexed McBSP1/UTOPIA pins function as McBSP1 and all other standalone UTOPIA pins are tied-off (Hi-Z). 1 – UTOPIA peripheral enabled (McBSP1 functions are disabled). This means all multiplexed McBSP1/UTOPIA pins now function as UTOPIA and all other standalone McBSP1 pins are tied-off (Hi-Z). |

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

DEVICE CONFIGURATIONS (CONTINUED)

Table 28. Device Configuration Pins (BEA[20:13, 9:7], HD5, and BEA11) (Continued)

| CONFIGURATION PIN | NO. | FUNCTIONAL DESCRIPTION | | |
|---|-------------------|--|---|--|
| | | C6414T Devices | C6415T Devices | C6416T Devices |
| BEA7 BEA8 BEA9 | D15 A16 B16 | Do not oppose internal pulldown (IPD) Do not oppose IPD Do not oppose IPD | Pullup† Do not oppose IPD Do not oppose IPD | Do not oppose IPD Pullup† Pullup† |
| †For proper device operation, this pin must be externally pulled up with a 1-kΩ resistor. | | | | |
| HD5 | Y1 | HPI peripheral bus width (HPI_WIDTH) 0 – HPI operates as an HPI16. (HPI bus is 16 bits wide. HD[15:0] pins are used and the remaining HD[31:16] pins are reserved pins in the Hi-Z state.) 1 – HPI operates as an HPI32. (HPI bus is 32 bits wide. All HD[31:0] pins are used for host-port operations.) | | |

multiplexed pins

Multiplexed pins are pins that are shared by more than one peripheral and are internally multiplexed. Some of these pins are configured by software, and the others are configured by external pullup/pulldown resistors only at reset. Those muxed pins that are configured by software can be programmed to switch functionalities at any time. Those muxed pins that are configured by external pullup/pulldown resistors are mutually exclusive; only one peripheral has primary control of the function of these pins after reset. Table 29 identifies the multiplexed pins on the C6414T, C6415T, and C6416T devices; shows the default (primary) function and the default settings after reset; and describes the pins, registers, etc. necessary to configure specific multiplexed functions.

debugging considerations

It is recommended that external connections be provided to device configuration pins, including CLKMODE[1:0], BEA[20:13, 11, 9:7], HD5/AD5, PCI_EN, and MCBSP2_EN. Although internal pullup/pulldown resistors exist on these pins (except for HD5/AD5), providing external connectivity adds convenience to the user in debugging and flexibility in switching operating modes.

Internal pullup/pulldown resistors also exist on the non-configuration pins on the BEA bus (BEA[12, 10, 6:1]). Do not oppose the internal pullup/pulldown resistors on these non-configuration pins with external pullup/pulldown resistors. If an external controller provides signals to these non-configuration pins, these signals must be driven to the default state of the pins at reset, or not be driven at all.

For the internal pullup/pulldown resistors on the C6414T, C6415T, and C6416T device pins, see the terminal functions table.

DEVICE CONFIGURATIONS (CONTINUED)

Table 29. C6414T, C6415T, and C6416T Device Multiplexed Pins†

| MULTIPLEXED PINS NAME NO. | | DEFAULT FUNCTION | DEFAULT SETTING | DESCRIPTION |
|------------------------------|------|--------------------|--|--|
| CLKOUT4/GP1‡ | AE6 | CLKOUT4 | GP1EN = 0 (disabled) | These pins are software-configurable. To use these pins as GPIO pins, the GPxEN bits in the GPIO Enable Register and the GPxDIR bits in the GPIO Direction Register must be properly configured. GPxEN = 1: GPx pin enabled GPxDIR = 0: GPx pin is an input GPxDIR = 1: GPx pin is an output |

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

Terminal Functions (Continued)

| SIGNAL NAME | NO. | TYPE† | IPD/ IPU‡ | DESCRIPTION |
|--|-----|-------|---|---|
| RESETS, INTERRUPTS, AND GENERAL-PURPOSE INPUT/OUTPUTS | | | | |
| RESET | AC7 | I | | Device reset |
| NMI | B4 | I | IPD | Nonmaskable interrupt, edge-driven (rising edge) Any noise on the NMI pin may trigger an NMI interrupt; therefore, if the NMI pin is not used, it is recommended that the NMI pin be grounded versus relying on the IPD. |
| GP7/EXT_INT7 | AF4 | I/O/Z | IPU | General-purpose input/output (GPIO) pins (I/O/Z) or external interrupts (input only). The default after reset setting is GPIO enabled as input-only. • When these pins function as External Interrupts [by selecting the corresponding interrupt enable register bit (IER.[7:4])], they are edge-driven and the polarity can be independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0]). |
| GP6/EXT_INT6 | AD5 | | | |
| GP5/EXT_INT5 | AE5 | | | |
| GP4/EXT_INT4 | AF5 | | | |
| GP15/PRST§ | G3 | I/O/Z | | General-purpose input/output (GPIO) 15 pin (I/O/Z) or PCI reset (I). No function at default. |
| GP14/PCLK§ | F2 | | GPIO 14 pin (I/O/Z) or PCI clock (I). No function at default. | |
| GP13/PINTA§ | G4 | | GPIO 13 pin (I/O/Z) or PCI interrupt A (O/Z). No function at default. | |
| GP12/PGNT§ | J3 | | GPIO 12 pin (I/O/Z) or PCI bus grant (I). No function at default. | |
| GP11/PREQ§ | F1 | | GPIO 11 pin (I/O/Z) or PCI bus request (O/Z). No function at default. | |
| GP10/PCBE3§ | L2 | | GPIO 10 pin (I/O/Z) or PCI command/byte enable 3 (I/O/Z). No function at default. | |
| GP9/PIDSEL§ | M3 | | GPIO 9 pin (I/O/Z) or PCI initialization device select (I). No function at default. | |
| GP3 | AC6 | | IPD | GPIO 3 pin (I/O/Z). The default after reset setting is GPIO 3 enabled as input-only. |
| GP0 | AF6 | | IPD | GPIO 0 pin. The general-purpose I/O 0 pin (GPIO 0) (I/O/Z) can be programmed as GPIO 0 (input only) [default] or as GPIO 0 (output only) pin or output as a general-purpose interrupt (GPOINT) signal (output only). |
| CLKS2/GP8§¶ | AE4 | | I/O/Z | IPD |
| CLKOUT6/GP2§¶ | AD6 | I/O/Z | IPD | Clock output at 1/6 of the device speed (O/Z) [default] or this pin can be programmed as a GPIO 2 pin (I/O/Z). |
| CLKOUT4/GP1§¶ | AE6 | I/O/Z | IPD | Clock output at 1/4 of the device speed (O/Z) [default] or this pin can be programmed as a GPIO 1 pin (I/O/Z). |
| HOST-PORT INTERFACE (HPI) [C64x] or PERIPHERAL COMPONENT INTERCONNECT (PCI) [C6415T or C6416T devices only] | | | | |
| PCI_EN | AA4 | I | IPD | PCI enable pin. This pin controls the selection (enable/disable) of the HPI and GP[15:9], or PCI peripherals. This pin works in conjunction with the MCBSP2_EN pin to enable/disable other peripherals (for more details, see the Device Configurations section of this data sheet). |
| HINT/PFRAME§ | R4 | I/O/Z | | Host interrupt from DSP to host (O) [default] or PCI frame (I/O/Z) |
| HCNTL1/ PDEVSEL§ | R1 | I/O/Z | | Host control – selects between control, address, or data registers (I) [default] or PCI device select (I/O/Z). |
| HCNTL0/ PSTOPS§ | T4 | I/O/Z | | Host control – selects between control, address, or data registers (I) [default] or PCI stop (I/O/Z) |
| HHWIL/PTRDY§ | R3 | I/O/Z | | Host half-word select – first or second half-word (not necessarily high or low order) [For HPI16 bus width selection only] (I) [default] or PCI target ready (I/O/Z) |
| HR/W/PCBE2§ | P1 | I/O/Z | | Host read or write select (I) [default] or PCI command/byte enable 2 (I/O/Z) |

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

§ For the C6415T and C6416T devices, these pins are multiplexed pins. For more details, see the Device Configurations section of this data sheet.
The C6414T device does *not* support the PCI or UTOPIA peripherals; therefore, these muxed peripheral pins are standalone peripheral functions for this device.

¶ For the C6414T device, only these pins are multiplexed pins.

| SIGNAL NAME | NO. | TYPE† | IPD/ IPU‡ | DESCRIPTION |
|---|------|-------|--------------|--|
| UNIVERSAL TEST AND OPERATIONS PHY INTERFACE FOR ASYNCHRONOUS TRANSFER MODE (ATM) [UTOPIA SLAVE] [C6415T and C6416T devices only] | | | | |
| UTOPIA SLAVE (ATM CONTROLLER) – TRANSMIT INTERFACE | | | | |
| UXCLK ^Ψ | AD11 | I | □ | Source clock for UTOPIA transmit driven by Master ATM Controller. When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off. |
| UXCLAV ^Ψ | AC14 | O/Z | | Transmit cell available status output signal from UTOPIA Slave. 0 indicates a complete cell is NOT available for transmit 1 indicates a complete cell is available for transmit When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off. |
| <u>UXENB</u> ^Ψ | AE15 | I | ◇ | UTOPIA transmit interface enable input signal. Asserted by the Master ATM Controller to indicate that the UTOPIA Slave should put out on the Transmit Data Bus the first byte of valid data and the UXSOC signal in the next clock cycle. When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off. |
| UXSOC ^Ψ | AC13 | O/Z | | Transmit Start-of-Cell signal. This signal is output by the UTOPIA Slave on the rising edge of the UXCLK, indicating that the first valid byte of the cell is available on the 8-bit Transmit Data Bus (UXDATA[7:0]). When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off. |
| DX1/ UXADDR4§ | AB11 | I/O/Z | ◇ | McBSP1 [default] or UTOPIA transmit address pins As UTOPIA transmit address pins UXADDR[4:0] (I), UTOPIA_EN (BEA11 pin) = 1: <ul style="list-style-type: none"> • 5-bit Slave transmit address input pins driven by the Master ATM Controller to identify and select one of the Slave devices (up to 31 possible) in the ATM System. • UXADDR0 pin is tied off when the UTOPIA peripheral is disabled [UTOPIA_EN (BEA11 pin) = 0] For the McBSP1 pin functions (UTOPIA_EN (BEA11 pin) = 0 [default]), see the MULTICHANNEL BUFFERED SERIAL PORT 1 (McBSP1) section of this table. |
| FSX1/ UXADDR3§ | AB13 | I/O/Z | ◇ | McBSP1 [default] or UTOPIA transmit address pins As UTOPIA transmit address pins UXADDR[4:0] (I), UTOPIA_EN (BEA11 pin) = 1: <ul style="list-style-type: none"> • 5-bit Slave transmit address input pins driven by the Master ATM Controller to identify and select one of the Slave devices (up to 31 possible) in the ATM System. |
| FSR1/ UXADDR2§ | AC9 | I/O/Z | ◇ | <ul style="list-style-type: none"> • UXADDR0 pin is tied off when the UTOPIA peripheral is disabled [UTOPIA_EN (BEA11 pin) = 0] |
| DR1/ UXADDR1§ | AF11 | I | ◇ | |
| UXADDR0 ^Ψ | AE9 | I | ◇ | For the McBSP1 pin functions (UTOPIA_EN (BEA11 pin) = 0 [default]), see the MULTICHANNEL BUFFERED SERIAL PORT 1 (McBSP1) section of this table. |

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

§ For the C6415T and C6416T devices, these pins are multiplexed pins. For more details, see the Device Configurations section of this data sheet. The C6414T device does *not* support the PCI or UTOPIA peripherals; therefore, these muxed peripheral pins are standalone peripheral functions for this device.

□ For the C6415T and C6416T devices, external pulldowns required: *If* UTOPIA is selected (BEA11 = 1) *and* these pins are connected to other devices, then a 10-kΩ resistor must be used to **externally** pull down each of these pins. If these pins are “no connects”, then only UXCLK and URCLK need to be pulled down and other pulldowns are not necessary.

◇ For the C6415T and C6416T devices, external pullups required: *If* UTOPIA is selected (BEA11 = 1) *and* these pins are connected to other devices, then a 10-kΩ resistor must be used to **externally** pull up each of these pins. If these pins are “no connects”, then the pullups are not necessary.

Ψ The C6414T device does not support the UTOPIA peripheral; therefore, these standalone UTOPIA pins are **Reserved** (leave unconnected, **do not** connect to power or ground) with the exception of UXCLK and URCLK which should be connected to a 10-kΩ pulldown resistor (see the square [□] footnote).

| RSV | A3 | | | Reserved (leave unconnected, do not connect to power or ground. If the signal must be routed out from the device, the internal pull-up/down resistance should not be relied upon and an external pull-up/down should be used). |
| | G2 | | | |
| | H3 | | | |
| | J4 | | | |
| | K6 | | | |
| | N3 | | | |
| | P3 | | | |
| RSV | W25 | | IPD | Reserved. This pin must be connected directly to V _{SS} for proper device operation. |

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

□ External pulldowns required: *If* UTOPIA is selected (BEA11 = 1) *and* these pins are connected to other devices, then a 10-kΩ resistor must be used to **externally** pull down each of these pins. If these pins are “no connects”, then only UXCLK and URCLK need to be pulled down and other pulldowns are not necessary.

^ψThe C6414T device does not support the UTOPIA peripheral; therefore, these standalone UTOPIA pins are **Reserved** (leave unconnected, **do not** connect to power or ground) with the exception of UXCLK and URCLK which should be connected to a 10-kΩ pulldown resistor (see the square [□] footnote).

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)

EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, DSP/BIOS, and XDS are trademarks of Texas Instruments.

device support

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. (e.g., **TMS320C6415TGLZ7**) Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

| | |
|------------|--|
| TMX | Experimental device that is not necessarily representative of the final device's electrical specifications |
| TMP | Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification |
| TMS | Fully qualified production device |

Support tool development evolutionary flow:

| | |
|-------------|---|
| TMDX | Development-support product that has not yet completed Texas Instruments internal qualification testing |
| TMDS | Fully qualified development-support product |

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLZ), the temperature range (for example, "blank" is the default commercial temperature range), and the device speed range in megahertz (for example, 7 is 720-MHz). Figure 5 provides a legend for reading the complete device name for any TMS320C64x™ DSP generation member.

The ZLZ package, like the GLZ package, is a 532-ball plastic BGA *only* with Pb-free balls. The CLZ is the Pb-Free die bump and solder ball version of GLZ and ZLZ. For device part numbers and further ordering information for TMS320C6414T/TMS320C6415T/TMS320C6416T in the GLZ, ZLZ and CLZ package types, see the TI website (<http://www.ti.com>) or contact your TI sales representative.

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

device and development-support tool nomenclature (continued)

† The extended temperature “A version” devices may have different operating conditions than the commercial temperature devices.

‡ See the Recommended Operating Conditions section of this data sheet for more details.

§ BGA = Ball Grid Array

¶ For the actual device part numbers (P/Ns) and ordering information, see the TI website (www.ti.com).

The ZLZ mechanical package designator represents the version of the GLZ with Pb-Free soldered balls.

|| The CLZ mechanical package designator represents the version of the GLZ and ZLZ with Pb-Free die bump and solder balls.

Figure 5. TMS320C64x™ DSP Device Nomenclature (Including the C6414T, C6415T, and C6416T Devices)

documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ DSP CPU (core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the TMS320C62x™/TMS320C67x™ devices, associated development tools, and third-party support.

The *TMS320C64x Technical Overview* (literature number SPRU395) gives an introduction to the C64x™ digital signal processor, and discusses the application areas that are enhanced by the C64x™ DSP Velocity™ VLIW architecture.

The *TMS320C6414T, TMS320C6415T, and TMS320C6416T Digital Signal Processors Silicon Errata* (literature number SPRZ216) describes the known exceptions to the functional specifications for the TMS320C6414T, TMS320C6415T, and TMS320C6416T devices.

The *Using IBIS Models for Timing Analysis* application report (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The *Migrating From TMS320C6416/15/14 to TMS320C6416T/15T/14T* application report (literature number SPRA981) provides more detailed information on the device compatibility, similarities/differences, and migration from a TMS320C6416 device to the TMS320C6414T/C6415T/C6416T devices.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

TMS320C67x is a trademark of Texas Instruments.

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

clock PLL

Most of the internal C64x™ DSP clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 6 shows the external PLL circuitry for either x1 (PLL bypass) or other PLL multiply modes.

To ensure proper operation of the PLL, a specified power-on reset sequence must be followed. For more detail on the specified power-on reset sequence, see the power-supply sequencing section of this data sheet.

To minimize the clock jitter, a single clean power supply should power both the C64x™ DSP device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the DSP requirements in this data sheet (see the *electrical characteristics over recommended ranges of supply voltage and operating case temperature* table and the *input and output clocks* electricals section). Table 30 lists some examples of compatible CLKIN external clock sources:

Table 30. Compatible CLKIN External Clock Sources

| COMPATIBLE PARTS FOR EXTERNAL CLOCK SOURCES (CLKIN) | PART NUMBER | MANUFACTURER |
|---|---------------------------|----------------------------|
| Oscillators | JITO-2 | Fox Electronix |
| | STA series, ST4100 series | SaRonix Corporation |
| | SG-636 | Epson America |
| | 342 | Corning Frequency Control |
| PLL | ICS525-02 | Integrated Circuit Systems |

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

clock PLL (continued)

Table 31. TMS320C64x PLL Multiply Factor Options, Clock Frequency Ranges, and Typical Lock Time†‡

| GLZ, ZLZ and CLZ PACKAGES – 23 x 23 mm BGA | | | | | | | |
|--|----------|--------------------------------------|-------------------------|---------------------------------------|------------------------|------------------------|-------------------------------------|
| CLKMODE1 | CLKMODE0 | CLKMODE (PLL MULTIPLY FACTORS) | CLKIN RANGE (MHz) | CPU CLOCK FREQUENCY RANGE (MHz) | CLKOUT4 RANGE (MHz) | CLKOUT6 RANGE (MHz) | TYPICAL LOCK TIME (μ s)§ |
| 0 | 0 | Bypass (x1) | 0–100 | 0–100 | 0–25 | 0–16.6 | N/A |
| 0 | 1 | x6 | 42–75 | 252–450 | 63–112.5 | 42–75 | 75 |
| 1 | 0 | x12 | 42–75 | 504–900 | 126–225 | 84–150 | |
| 1 | 1 | x20 | 25–50 | 500–1000 | 125–250 | 83.3–166.6 | |

† These clock frequency range values are applicable to a C64x–600, –720, –850, and –1000-MHz speed devices. For more detailed information, see the CLKIN timing requirements table for the specific device speed.

‡ Use external pullup resistors on the CLKMODE pins (CLKMODE1 and CLKMODE0) to set the C64x device to one of the valid PLL multiply clock modes (x6, x12, or x20). With internal pulldown resistors on the CLKMODE pins (CLKMODE1, CLKMODE0), the default clock mode is x1 (bypass).

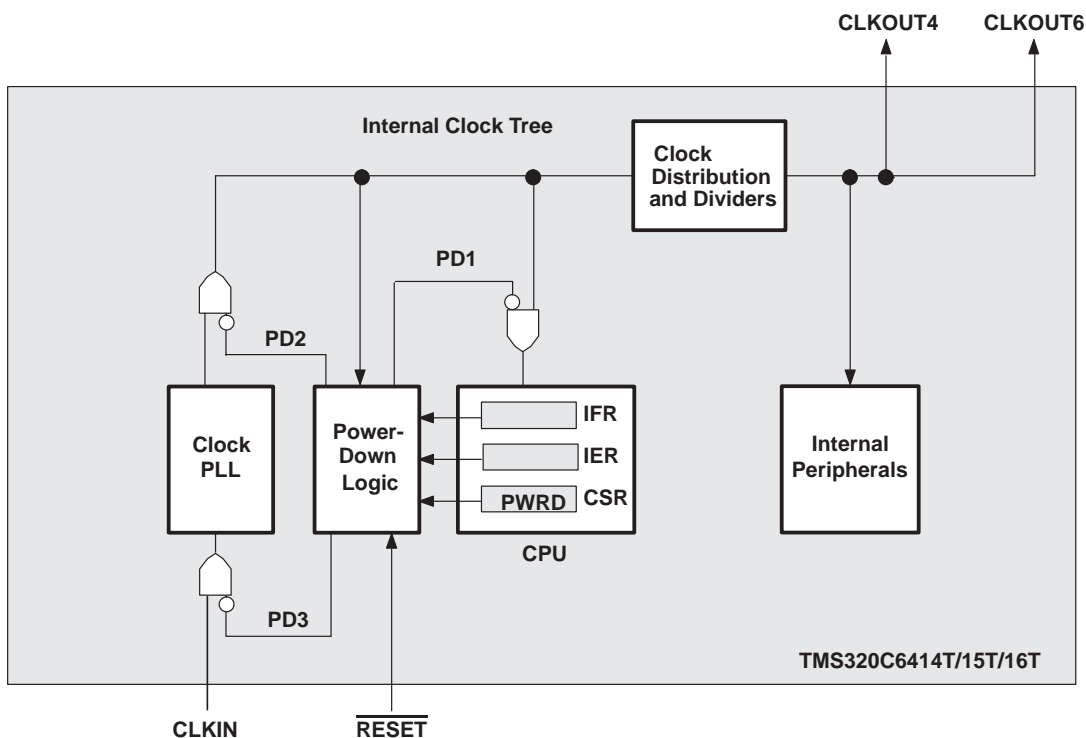

§ Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μ s, the maximum value may be as long as 250 μ s.

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

power-down mode logic

Figure 9 shows the power-down mode logic on the C6414T/C6415T/C6416T.

† External input clocks, with the exception of CLKIN, are *not* gated by the power-down mode logic.

Figure 9. Power-Down Mode Logic†

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 10 and described in Table 32. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when writing to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R/W-x = Read/write reset value

NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 10. PWRD Field of the CSR Register

A delay of up to nine clock cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled interrupt, the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 32 summarizes all the power-down modes.

Table 32. Characteristics of the Power-Down Modes

| PRWD FIELD (BITS 15–10) | POWER-DOWN MODE | WAKE-UP METHOD | EFFECT ON CHIP'S OPERATION |
|-------------------------|------------------|---|--|
| 000000 | No power-down | — | — |
| 001001 | PD1 | Wake by an enabled interrupt | CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, EDMA transactions can proceed between peripherals and internal memory. |
| 010001 | PD1 | Wake by an enabled or non-enabled interrupt | |
| 011010 | PD2 [†] | Wake by a device reset | Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. |

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

Table 32. Characteristics of the Power-Down Modes

| PRWD FIELD (BITS 15–10) | POWER-DOWN MODE | WAKE-UP METHOD | EFFECT ON CHIP'S OPERATION |
|-------------------------|------------------|------------------------|--|
| 011100 | PD3 [†] | Wake by a device reset | Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O “freeze” in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up. |
| All others | Reserved | — | — |

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

C64x power-down mode with an emulator

If user power-down modes are programmed, and an emulator is attached, the modes will be masked to allow the emulator access to the system. This condition prevails until the emulator is reset or the cable is removed from the header. If power measurements are to be performed when in a power-down mode, the emulator cable should be removed.

When the DSP is in power-down mode PD2 or PD3, emulation logic will force any emulation execution command (such as Step or Run) to spin in IDLE. For this reason, PC writes (such as loading code) will fail. A DSP reset will be required to get the DSP out of PD2/PD3.

power-supply sequencing

TI DSPs typically do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that the Core is powered up prior to the I/O supply and that the I/O supply is powered up within ≤ 200 ms of the core. This power sequence becomes even more important in multiprocessor designs.

In addition, for proper device initialization, device reset ($\overline{\text{RESET}}$) must be held active (low) during device power ramp and should not be released until the PLL becomes stable.

power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 11).

Figure 11. Schottky Diode Diagram

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

power-supply decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps, 30 for the core supply and 30 for the I/O supply. These caps need to be close to the DSP power pins, no more than 1.25 cm maximum distance to be effective. Physically smaller caps, such as 0402, are better because of their lower parasitic inductance. Proper capacitance values are also important. Small bypass caps (near 560 pF) should be closest to the power pins. Medium bypass caps (220 nF or as large as can be obtained in a small package) should be next closest. TI recommends no less than 8 small and 8 medium caps per supply (32 total) be placed immediately next to the BGA vias, using the “interior” BGA space and at least the corners of the “exterior”.

Eight larger caps (4 for each supply) can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 μ F) should be furthest away (but still as close as possible). No less than 4 large caps per supply (8 total) should be placed outside of the BGA.

Any cap selection needs to be evaluated from a yield/manufacturing point-of-view. As with the selection of any component, verification of capacitor availability over the product’s production lifetime should be considered.

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

IEEE 1149.1 JTAG compatibility statement

The TMS320C6414T/15T/16T DSP requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the DSP core, $\overline{\text{TRST}}$ initializes the DSP's emulation logic. Both resets are required for proper operation.

Note: $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCLK; otherwise, BSCAN may not respond as expected after $\overline{\text{TRST}}$ is asserted.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the DSP to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state. $\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality. $\overline{\text{RESET}}$ must be released only in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$.

For maximum reliability, the TMS320C6414T/15T/16T DSP includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized. JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the DSP after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

Following the release of $\overline{\text{RESET}}$, the low-to-high transition of $\overline{\text{TRST}}$ must be "seen" to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

Note: The DESIGN_WARNING section of the C6414T, C6415T, C6416T GLZ BSDL file contains information and constraints regarding proper device operation while in Boundary Scan Mode.

For more detailed information on the C6414T/15T/16T JTAG emulation, see the *TMS320C6000 DSP Designing for JTAG Emulation Reference Guide* (literature number SPRU641).

EMIF device speed

The rated EMIF speed, referring to both EMIFA and EMIFB, of these devices only applies to the SDRAM interface when in a system that meets the following requirements:

- 1 chip-enable (CE) space (maximum of 2 chips) of SDRAM connected to EMIF
- up to 1 CE space of buffers connected to EMIF
- EMIF trace lengths between 1 and 3 inches
- 166-MHz SDRAM for 133-MHz operation (applies only to EMIFA)
- 143-MHz SDRAM for 100-MHz operation

Timing analysis must be done to verify all AC timings are met for all configurations. Verification of AC timings is mandatory when using configurations other than those specified above. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings.

To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

bootmode

The C6414T/15T/16T device resets using the active-low signal $\overline{\text{RESET}}$. While $\overline{\text{RESET}}$ is low, the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of $\overline{\text{RESET}}$ starts the processor running with the prescribed device configuration and boot mode.

The C6414T/C6415T/C6416T has three types of boot modes:

- Host boot

If host boot is selected, upon release of $\overline{\text{RESET}}$, the CPU is internally “stalled” while the remainder of the device is released. During this period, an external host can initialize the CPU’s memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. For the C6414T device, the HPI peripheral is used for host boot. For the C6415T/C6416T device, the HPI peripheral is used for host boot if $\text{PCI_EN} = 0$, and the PCI peripheral is used for host boot if $\text{PCI_EN} = 1$. Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the “stalled” state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally “stalled”. Also, DSPINT brings the CPU out of the “stalled” state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the “stalled” state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

- EMIF boot (using default ROM timings)

Upon the release of $\overline{\text{RESET}}$, the 1K-Byte ROM code located in the beginning of $\overline{\text{CE1}}$ is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. In this case, the EMIF automatically assembles consecutive 8-bit bytes to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and starts running from address 0.

- No boot

With no boot, the CPU begins direct execution from the memory located at address 0. Note: operation is undefined if invalid code is located at address 0.

reset

A hardware reset ($\overline{\text{RESET}}$) is required to place the DSP into a known good state out of power-up. The $\overline{\text{RESET}}$ signal can be asserted (pulled low) prior to ramping the core and I/O voltages or after the core and I/O voltages have reached their proper operating conditions. As a best practice, reset should be held low during power-up. Prior to deasserting $\overline{\text{RESET}}$ (low-to-high transition), the core and I/O voltages should be at their proper operating conditions and CLKIN should also be running at the correct frequency.

| | Partial extended temperature devices [D-1000 <i>only</i>] | –40 | | 90 | °C |

‡ Future variants of the C641xT DSPs may operate at voltages ranging from 1.0 V to 1.2 V to provide a range of system power/performance options. TI highly recommends that users design-in a supply that can handle multiple voltages within this range (with $\pm 3\%$ tolerances) by implementing simple board changes such as reference resistor values or input pin configuration modifications. Examples of such supplies include the PT5406, PT5815, PT6476, PT6505, and PT6719 series from Power Trends, a subsidiary of Texas Instruments. Not incorporating a flexible supply may limit the system’s ability to easily adapt to future versions of C641xT devices.

§ The absolute maximum ratings should *not* be exceeded for more than 30% of the cycle period. This specification does not apply to PCI signals.

† For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

‡ Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.

§ PCI input leakage currents include Hi-Z output leakage for all bidirectional buffers with 3-state outputs.

¶ These rated numbers are from the PCI specification version 2.3. The DC specification and AC specification are defined in Tables 4-3 and 4-4, respectively.

Measured with average activity (50% high/50% low power). The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the *TMS320C6414T/15T/16T Power Consumption Application Report* (literature number SPRAA45).

recommended clock and control signal transition behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

PARAMETER MEASUREMENT INFORMATION

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 12. Test Load Circuit for AC Timing Measurements

The tester load circuit is for characterization and measurement of AC timing signals. This load does not indicate the maximum load the device is capable of driving.

signal transition levels

All input and output timing parameters are referenced to 1.5 V for both “0” and “1” logic levels.

Figure 13. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IH\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks, $V_{ILP\ MAX}$ and $V_{IHP\ MIN}$ for PCI input clocks, and $V_{OLP\ MAX}$ and $V_{OHP\ MIN}$ for PCI output clocks.

Figure 14. Rise and Fall Transition Time Voltage Reference Levels

signal transition rates

All timings are tested with an input edge rate of 4 Volts per nanosecond (4 V/ns).

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 33 and Figure 15).

Figure 15 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

Table 33. Board-Level Parameters Example (see Figure 15)

| NO. | DESCRIPTION |
|-----|--|
| 1 | Clock route delay |
| 2 | Minimum DSP hold time |
| 3 | Minimum DSP setup time |
| 4 | External device hold time requirement |
| 5 | External device setup time requirement |
| 6 | Control signal route delay |
| 7 | External device hold time |
| 8 | External device access time |
| 9 | DSP hold time requirement |
| 10 | DSP setup time requirement |
| 11 | Data route delay |

† Control signals include data for Writes.

‡ Data signals are generated during Reads from an external device.

§ P = 1/CPU clock frequency in nanoseconds (ns)

Figure 18. CLKOUT6 Timing

INPUT AND OUTPUT CLOCKS (CONTINUED)

timing requirements for ECLKIN for EMIFA and EMIFB†‡§¶ (see Figure 19)

| NO. | | | -600 -720 -850 -1G | | UNIT | |
|-----|----------------|-----------------------------|-----------------------------|-------|------|----|
| | | | MIN | MAX | | |
| 1 | $t_{c(EKI)}$ | Cycle time, ECLKIN | $CV_{DD} = 1.2\text{ V}$ | 6# | 16P | ns |
| | | | $CV_{DD} = 1.1\text{ V}$ | 7.5# | 16P | ns |
| 2 | $t_{w(EKI H)}$ | Pulse duration, ECLKIN high | | 2.7 | | ns |
| 3 | $t_{w(EKI L)}$ | Pulse duration, ECLKIN low | | 2.7 | | ns |
| 4 | $t_t(EKI)$ | Transition time, ECLKIN | | | 2 | ns |
| 5 | $t_J(EKI)$ | Period jitter, ECLKIN | | 0.02E | | ns |

† P = 1/CPU clock frequency in ns. For example, when running parts at 720 MHz, use P = 1.39 ns.

‡ The reference points for the rise and fall transitions are measured at $V_{IL\text{ MAX}}$ and $V_{IH\text{ MIN}}$.

§ These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). All EMIFA signals are prefixed by an "A" and all EMIFB signals are prefixed by a "B". Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted.

¶ E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

Minimum ECLKIN cycle times *must* be met, even when ECLKIN is generated by an internal clock source. Minimum ECLKIN times are based on internal logic speed; the maximum useable speed of the EMIF may be lower due to AC timing requirements. On the devices, 133-MHz operation is achievable if the requirements of the EMIF Device Speed section are met.

Figure 19. ECLKIN Timing for EMIFA and EMIFB

switching characteristics over recommended operating conditions for ECLKOUT1 for EMIFA and EMIFB modules§¶||★ (see Figure 20)

| NO. | PARAMETER | -600 -720 -850 -1G | | UNIT |
|-----|---------------------|-----------------------------|-------------------|------|
| | | MIN | MAX | |
| 1 | $t_J(EKO1)$ | 0 | $\pm 175^\square$ | ps |
| 2 | $t_{w(EKO1 H)}$ | EH - 0.7 | EH + 0.7 | ns |
| 3 | $t_{w(EKO1 L)}$ | EL - 0.7 | EL + 0.7 | ns |
| 4 | $t_t(EKO1)$ | | 1 | ns |
| 5 | $t_d(EKI H-EKO1 H)$ | 0.8 | 8 | ns |
| 6 | $t_d(EKI L-EKO1 L)$ | 0.8 | 8 | ns |

§ These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). All EMIFA signals are prefixed by an "A" and all EMIFB signals are prefixed by a "B". Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted.

¶ E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

|| The reference points for the rise and fall transitions are measured at $V_{OL\text{ MAX}}$ and $V_{OH\text{ MIN}}$.

★ EH is the high period of E (EMIF input clock period) in ns and EL is the low period of E (EMIF input clock period) in ns for EMIFA or EMIFB.

□ This cycle-to-cycle jitter specification was measured with CPU/4 or CPU/6 as the source of the EMIF input clock.

| 6 | $t_d(EKIH-EKO2L)$ Delay time, ECLKIN high to ECLKOUT2 low | 3 | 8 | ns |

† The reference points for the rise and fall transitions are measured at $V_{OL\ MAX}$ and $V_{OH\ MIN}$.
 ‡ These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). All EMIFA signals are prefixed by an "A" and all EMIFB signals are prefixed by a "B". Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted.
 § E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.
 N = the EMIF input clock divider; N = 1, 2, or 4.
 ¶ This cycle-to-cycle jitter specification was measured with CPU/4 or CPU/6 as the source of the EMIF input clock.

Figure 21. ECLKOUT2 Timing for the EMIFA and EMIFB Modules

ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles for EMIFA module†‡§
(see Figure 22 and Figure 23)

| NO. | | | -600 -720 -850 -1G | | UNIT |
|-----|------------------------------|---|-----------------------------|-----|------|
| | | | MIN | MAX | |
| 3 | t _{su} (EDV-AREH) | Setup time, EDx valid before $\overline{\text{ARE}}$ high | 6.5 | | ns |
| 4 | t _h (AREH-EDV) | Hold time, EDx valid after $\overline{\text{ARE}}$ high | 1 | | ns |
| 6 | t _{su} (ARDY-EKO1H) | Setup time, ARDY valid before ECLKOUTx high | 3 | | ns |
| 7 | t _h (EKO1H-ARDY) | Hold time, ARDY valid after ECLKOUTx high | 1 | | ns |

† To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. The ARDY signal is *only* recognized two cycles before the end of the programmed strobe time and while ARDY is low, the strobe time is extended cycle-by-cycle. When ARDY is recognized low, the end of the strobe time is two cycles after ARDY is recognized high. To use ARDY as an asynchronous input, the pulse width of the ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.

‡ RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

§ These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., the asynchronous memory access signals are shown as generic (AOE, ARE, and AWE) instead of AAOE, AARE, and AAW (for EMIFA) and BAOE, BARE, and BAW (for EMIFB)].

switching characteristics over recommended operating conditions for asynchronous memory cycles for EMIFA module†‡§¶ (see Figure 22 and Figure 23)

| NO. | PARAMETER | | -600 -720 -850 -1G | | UNIT |
|-----|------------------------------|--|-----------------------------|-----|------|
| | | | MIN | MAX | |
| 1 | t _{osu} (SELV-AREL) | Output setup time, select signals valid to $\overline{\text{ARE}}$ low | RS * E – 1.5 | | ns |
| 2 | t _{oh} (AREH-SELIV) | Output hold time, $\overline{\text{ARE}}$ high to select signals invalid | RH * E – 1.9 | | ns |
| 5 | t _d (EKO1H-AREV) | Delay time, ECLKOUTx high to $\overline{\text{ARE}}$ valid | 1 | 7 | ns |
| 8 | t _{osu} (SELV-AWEL) | Output setup time, select signals valid to $\overline{\text{AWE}}$ low | WS * E – 1.7 | | ns |
| 9 | t _{oh} (AWEH-SELIV) | Output hold time, $\overline{\text{AWE}}$ high to select signals invalid | WH * E – 1.8 | | ns |
| 10 | t _d (EKO1H-AWEV) | Delay time, ECLKOUTx high to $\overline{\text{AWE}}$ valid | 1.3 | 7.1 | ns |

† RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

‡ These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., the asynchronous memory access signals are shown as generic (AOE, ARE, and AWE) instead of AAOE, AARE, and AAW (for EMIFA) and BAOE, BARE, and BAW (for EMIFB)].

¶ E = ECLKOUT1 period in ns for EMIFA or EMIFB

Select signals for EMIFA include: ACEx, ABE[7:0], AEA[22:3], AAOE; and for EMIFA writes, include AED[63:0].
Select signals EMIFB include: BCEx, BBE[1:0], BEA[20:1], BAOE; and for EMIFB writes, include BED[15:0].

- Function of $\overline{SADS/SRE}$ (RENEN): For standard SBSRAM or ZBT SRAM interface, $\overline{SADS/SRE}$ acts as \overline{SADS} with deselect cycles (RENEN = 0). For FIFO interface, $\overline{SADS/SRE}$ acts as \overline{SRE} with NO deselect cycles (RENEN = 1).
- Synchronization clock (SNCKLK): Synchronized to ECLKOUT1 or ECLKOUT2

PROGRAMMABLE SYNCHRONOUS INTERFACE TIMING (CONTINUED)

† These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., the programmable synchronous interface access signals are shown as generic (SADS/SRE, SOE, and SWE) instead of ASADS/ASRE, ASOE, and ASWE (for EMIFA) and BSADS/BSRE, BSOE, and BSWE (for EMIFB)].

‡ The read latency and the length of CEx assertion are programmable via the SYNCRL and CEEXT fields, respectively, in the EMIFx CE Space Secondary Control register (CEXSEC). In this figure, SYNCRL = 2 and CEEXT = 0.

§ The following parameters are programmable via the EMIF CE Space Secondary Control register (CEXSEC):

- Read latency (SYNCRL): 0-, 1-, 2-, or 3-cycle read latency
- Write latency (SYNCWL): 0-, 1-, 2-, or 3-cycle write latency
- CEx assertion length (CEEXT): For standard SBSRAM or ZBT SRAM interface, CEx goes inactive after the final command has been issued (CEEXT = 0). For synchronous FIFO interface with glue, CEx is active when SOE is active (CEEXT = 1).
- Function of SADS/SRE (RENEN): For standard SBSRAM or ZBT SRAM interface, SADS/SRE acts as SADS with deselect cycles (RENEN = 0). For FIFO interface, SADS/SRE acts as SRE with NO deselect cycles (RENEN = 1).
- Synchronization clock (SNCKLK): Synchronized to ECLKOUT1 or ECLKOUT2

¶ ARE/SDCAS/SADS/SRE, AOE/SDRAS/SOE, and AWE/SDWE/SWE operate as SADS/SRE, SOE, and SWE, respectively, during programmable synchronous interface accesses.

TMS320C6414T, TMS320C6415T, TMS320C6416T FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

SYNCHRONOUS DRAM TIMING (CONTINUED)

† These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic ($\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, and $\overline{\text{SDRAS}}$) instead of $\overline{\text{ASDCAS}}$, $\overline{\text{ASDWE}}$, and $\overline{\text{ASDRAS}}$ (for EMIFA) and $\overline{\text{BSDCAS}}$, $\overline{\text{BSDWE}}$, and $\overline{\text{BSDRAS}}$ (for EMIFB)].

‡ $\overline{\text{ARE/SDCAS/SADS/SRE}}$, $\overline{\text{AWE/SDWE/SWE}}$, and $\overline{\text{AOE/SDRAS/SOE}}$ operate as $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, and $\overline{\text{SDRAS}}$, respectively, during SDRAM accesses.

§ $\overline{\text{PDT}}$ signal is only asserted when the EDMA is in PDT mode (set the PDTS bit to 1 in the EDMA options parameter RAM). For $\overline{\text{PDT}}$ read, data is not latched into EMIF. The PDTRL field in the PDT control register (PDTCTL) configures the latency of the $\overline{\text{PDT}}$ signal with respect to the data phase of a read transaction. The latency of the $\overline{\text{PDT}}$ signal for a read can be programmed to 0, 1, 2, or 3 by setting PDTRL to 00, 01, 10, or 11, respectively. PDTRL equals 00 (zero latency) in Figure 27.

Figure 27. SDRAM Read Command (CAS Latency 3) for EMIFA and EMIFB†

SYNCHRONOUS DRAM TIMING (CONTINUED)

† These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., the synchronous DRAM memory access signals are shown as generic (SDCAS, SDWE, and SDRAS) instead of ASDCAS, ASDWE, and ASDRAS (for EMIFA) and BSDCAS, BSDWE, and BSDRAS (for EMIFB)].

‡ ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE, and AOE/SDRAS/SOE operate as SDCAS, SDWE, and SDRAS, respectively, during SDRAM accesses.

§ PDT signal is only asserted when the EDMA is in PDT mode (set the PDTD bit to 1 in the EDMA options parameter RAM). For PDT write, data is not driven (in High-Z). The PDTWL field in the PDT control register (PDTCTL) configures the latency of the PDT signal with respect to the data phase of a write transaction. The latency of the PDT signal for a write transaction can be programmed to 0, 1, 2, or 3 by setting PDTWL to 00, 01, 10, or 11, respectively. PDTWL equals 00 (zero latency) in Figure 28.

HOLD/HOLDA TIMING

timing requirements for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles for EMIFA and EMIFB modules† (see Figure 35)

| NO. | | -600, -720 -850, -1G | | UNIT |
|-----|--|-------------------------|-----|------|
| | | MIN | MAX | |
| 3 | $t_{\text{H}}(\overline{\text{HOLDAL}}-\overline{\text{HOLDL}})$ Hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low | E | | ns |

† E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

switching characteristics over recommended operating conditions for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles for EMIFA and EMIFB modules†‡§ (see Figure 35)

| NO. | PARAMETER | -600, -720 -850, -1G | | UNIT |
|-----|--|-------------------------|-----|------|
| | | MIN | MAX | |
| 1 | $t_{\text{d}}(\overline{\text{HOLDL}}-\overline{\text{EMHZ}})$ Delay time, $\overline{\text{HOLD}}$ low to EMIF Bus high impedance | 2E | † | ns |
| 2 | $t_{\text{d}}(\overline{\text{EMHZ}}-\overline{\text{HOLDAL}})$ Delay time, EMIF Bus high impedance to $\overline{\text{HOLDA}}$ low | 0 | 2E | ns |
| 4 | $t_{\text{d}}(\overline{\text{HOLDH}}-\overline{\text{EMLZ}})$ Delay time, $\overline{\text{HOLD}}$ high to EMIF Bus low impedance | 2E | 7E | ns |
| 5 | $t_{\text{d}}(\overline{\text{EMLZ}}-\overline{\text{HOLDAH}})$ Delay time, EMIF Bus low impedance to $\overline{\text{HOLDA}}$ high | 0 | 2E | ns |
| 6 | $t_{\text{d}}(\overline{\text{HOLDL}}-\overline{\text{EKOHZ}})$ Delay time, $\overline{\text{HOLD}}$ low to ECLKOUTx high impedance | 2E | † | ns |
| 7 | $t_{\text{d}}(\overline{\text{HOLDH}}-\overline{\text{EKOLZ}})$ Delay time, $\overline{\text{HOLD}}$ high to ECLKOUTx low impedance | 2E | 7E | ns |

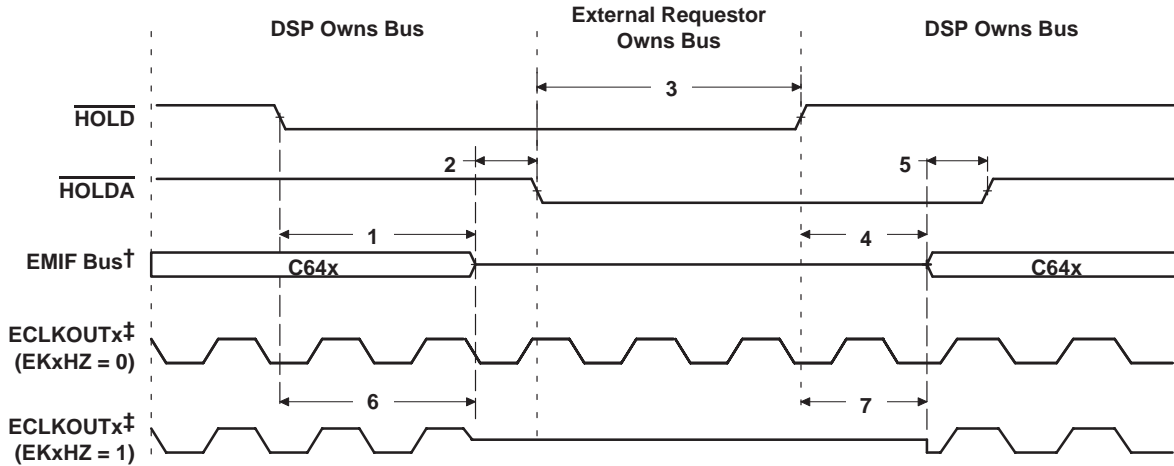

† E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

‡ For EMIFA, EMIF Bus consists of: $\overline{\text{ACE}}[3:0]$, $\overline{\text{ABE}}[7:0]$, $\overline{\text{AED}}[63:0]$, $\overline{\text{AEA}}[22:3]$, $\overline{\text{AARE}}/\overline{\text{ASDCAS}}/\overline{\text{ASADS}}/\overline{\text{ASRE}}$, $\overline{\text{AAOE}}/\overline{\text{ASDRAS}}/\overline{\text{ASOE}}$, and $\overline{\text{AAWE}}/\overline{\text{ASDWE}}/\overline{\text{ASWE}}$, $\overline{\text{ASDCKE}}$, $\overline{\text{ASOE3}}$, and $\overline{\text{APDT}}$.

For EMIFB, EMIF Bus consists of: $\overline{\text{BCE}}[3:0]$, $\overline{\text{BBE}}[1:0]$, $\overline{\text{BED}}[15:0]$, $\overline{\text{BEA}}[20:1]$, $\overline{\text{BARE}}/\overline{\text{BSDCAS}}/\overline{\text{BSADS}}/\overline{\text{BSRE}}$, $\overline{\text{BAOE}}/\overline{\text{BSDRAS}}/\overline{\text{BSOE}}$, and $\overline{\text{BAWE}}/\overline{\text{BSDWE}}/\overline{\text{BSWE}}$, $\overline{\text{BSOE3}}$, and $\overline{\text{BPDT}}$.

§ The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during $\overline{\text{HOLDA}}$. If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 35.

† All pending EMIF transactions are allowed to complete before $\overline{\text{HOLDA}}$ is asserted. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

† For EMIFA, EMIF Bus consists of: $\overline{\text{ACE}}[3:0]$, $\overline{\text{ABE}}[7:0]$, $\overline{\text{AED}}[63:0]$, $\overline{\text{AEA}}[22:3]$, $\overline{\text{AARE}}/\overline{\text{ASDCAS}}/\overline{\text{ASADS}}/\overline{\text{ASRE}}$, $\overline{\text{AAOE}}/\overline{\text{ASDRAS}}/\overline{\text{ASOE}}$, and $\overline{\text{AAWE}}/\overline{\text{ASDWE}}/\overline{\text{ASWE}}$, $\overline{\text{ASDCKE}}$, $\overline{\text{ASOE3}}$, and $\overline{\text{APDT}}$.

For EMIFB, EMIF Bus consists of: $\overline{\text{BCE}}[3:0]$, $\overline{\text{BBE}}[1:0]$, $\overline{\text{BED}}[15:0]$, $\overline{\text{BEA}}[20:1]$, $\overline{\text{BARE}}/\overline{\text{BSDCAS}}/\overline{\text{BSADS}}/\overline{\text{BSRE}}$, $\overline{\text{BAOE}}/\overline{\text{BSDRAS}}/\overline{\text{BSOE}}$, and $\overline{\text{BAWE}}/\overline{\text{BSDWE}}/\overline{\text{BSWE}}$, $\overline{\text{BSOE3}}$, and $\overline{\text{BPDT}}$.

‡ The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during $\overline{\text{HOLDA}}$. If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 35.

Figure 35. $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ Timing for EMIFA and EMIFB

BUSREQ TIMING

switching characteristics over recommended operating conditions for the BUSREQ cycles for EMIFA and EMIFB modules (see Figure 36)

| NO. | PARAMETER | -600 -720 -850 -1G | | UNIT |
|-----|---|-----------------------------|-----|------|
| | | MIN | MAX | |
| 1 | $t_d(\text{AEKO1H-ABUSRV})$ Delay time, AECLKOUTx high to ABUSREQ valid | 1 | 5.5 | ns |
| 2 | $t_d(\text{BEKO1H-BBUSRV})$ Delay time, BECLKOUTx high to BBUSREQ valid | 0.9 | 5.5 | ns |

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

RESET TIMING

timing requirements for reset† (see Figure 37)

| NO. | | | -600, -720, -850, -1G | | UNIT |
|-----|-----------------------------|--|--------------------------|-----|------|
| | | | MIN | MAX | |
| 1 | t _w (RST) | Width of the $\overline{\text{RESET}}$ pulse (PLL stable)‡ | 250 | | μs |
| | | Width of the $\overline{\text{RESET}}$ pulse (PLL needs to sync up)§ | 250 | | μs |
| 16 | t _{su} (boot) | Setup time, boot configuration bits valid before $\overline{\text{RESET}}$ high¶ | 4E or 4C# | | ns |
| 17 | t _h (boot) | Hold time, boot configuration bits valid after $\overline{\text{RESET}}$ high¶ | 4P | | ns |
| 18 | t _{su} (PCLK-RSTH) | Setup time, PCLK active before $\overline{\text{RESET}}$ high¶ | 32N | | ns |

† P = 1/CPU clock frequency in ns. For example, when running parts at 720 MHz, use P = 1.39 ns.

‡ This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x6, x12, x20 when CLKIN and PLL are stable.

§ This parameter applies to CLKMODE x6, x12, x20 only (it does not apply to CLKMODE x1). The $\overline{\text{RESET}}$ signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, $\overline{\text{RESET}}$ must be asserted to ensure proper device operation. See the *clock PLL* section for PLL lock times.

¶ EMIFB address pins BEA[20:13, 11, 9:7] are the boot configuration pins during device reset.

E = 1/AECLKIN clock frequency in ns. C = 1/CLKIN clock frequency in ns. Select whichever value is larger for the **MIN** parameter.

¶ N = the PCI input clock (PCLK) period in ns. When PCI is enabled (PCI_EN = 1), this parameter **must** be met.

switching characteristics over recommended operating conditions during reset†☆□ (see Figure 37)

| NO. | PARAMETER | -600, -720, -850, -1G | | UNIT |
|-----|---|--------------------------|----------|------|
| | | MIN | MAX | |
| 2 | t _d (RSTL-ECKI) Delay time, $\overline{\text{RESET}}$ low to ECLKIN synchronized internally | 2E | 3P + 20E | ns |
| 3 | t _d (RSTH-ECKI) Delay time, $\overline{\text{RESET}}$ high to ECLKIN synchronized internally | 2E | 16 070P | ns |
| 4 | t _d (RSTL-ECKO1HZ) Delay time, $\overline{\text{RESET}}$ low to ECLKOUT1 high impedance | 2E | | ns |
| 5 | t _d (RSTH-ECKO1V) Delay time, $\overline{\text{RESET}}$ high to ECLKOUT1 valid | | 16 070P | ns |

| 7 | t _d (RSTH-EMIFZV) Delay time, $\overline{\text{RESET}}$ high to EMIF Z valid | 16E | 16 070P | ns |
| 8 | t _d (RSTL-EMIFHIV) Delay time, $\overline{\text{RESET}}$ low to EMIF high group invalid | 2E | | ns |
| 9 | t _d (RSTH-EMIFHV) Delay time, $\overline{\text{RESET}}$ high to EMIF high group valid | | 16 070P | ns |
| 10 | t _d (RSTL-EMIFLIV) Delay time, $\overline{\text{RESET}}$ low to EMIF low group invalid | 2E | | ns |
| 11 | t _d (RSTH-EMIFLV) Delay time, $\overline{\text{RESET}}$ high to EMIF low group valid | | 16 070P | ns |
| 12 | t _d (RSTL-LOWIV) Delay time, $\overline{\text{RESET}}$ low to low group invalid | 0 | | ns |
| 13 | t _d (RSTH-LOWV) Delay time, $\overline{\text{RESET}}$ high to low group valid | | 16 070P | ns |
| 14 | t _d (RSTL-ZHZ) Delay time, $\overline{\text{RESET}}$ low to Z group high impedance | 0 | | ns |
| 15 | t _d (RSTH-ZV) Delay time, $\overline{\text{RESET}}$ high to Z group valid | 2P | 16 070P | ns |

† P = 1/CPU clock frequency in ns. For example, when running parts at 720 MHz, use P = 1.39 ns.

☆ E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

□ EMIF Z group consists of: AEA[22:3], BEA[20:1], AED[63:0], BED[15:0], CE[3:0], ABE[7:0], BBE[1:0], ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE, and AOE/SDRAS/SOE, SOE3, ASDCKE, and PDT.

EMIF high group consists of: AHOLDA and BHOLDA (when the corresponding HOLD input is high)

EMIF low group consists of: ABUSREQ and BBUSREQ; AHOLDA and BHOLDA (when the corresponding HOLD input is low)

Low group consists of: XSP_CS, CLKX2/XSP_CLK, and DX2/XSP_DO; all of which apply only when PCI EEPROM (BEA13) is enabled (with PCI_EN = 1 and MCBSP2_EN = 0). Otherwise, the CLKX2/XSP_CLK and DX2/XSP_DO pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.

Z group consists of: HD[31:0]/AD[31:0], CLKX0, CLKX1/URADDR4, CLKX2/XSP_CLK, FSX0, FSX1/UXADDR3, FSX2, DX0, DX1/UXADDR4, DX2/XSP_DO, CLR0, CLKR1/URADDR2, CLKR2, FSR0, FSR1/UXADDR2, FSR2, TOUT0, TOUT1, TOUT2, GP[8:0], GP10/PCBE3, HR/M/PCBE2, HDS2/PCBE1, PCBE0, GP13/PINTA, GP11/PREQ, HDS1/PSERR, HCS/PPERR, HCNTL1/PDEVSEL, HAS/PPAR, HCNTL0/PSTOP, HHWL/PTRDY (16-bit HPI mode only), HRDY/PIRDY, HINT/PFRAME, UXDATA[7:0], UXSOC, UXCLAV, and URCLAV.

RESET TIMING (CONTINUED)

† These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., ECLKIN, ECLKOUT1, and ECLKOUT2].

‡ EMIF Z group consists of: AEA[22:3], BEA[20:1], AED[63:0], BED[15:0], CE[3:0], ABE[7:0], BBE[1:0], ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE, and AOE/SDRAS/SOE, SOE3, ASDCKE, and PDT.

EMIF high group consists of: AHOLDA and BHOLDA (when the corresponding HOLD input is high)

EMIF low group consists of: ABUSREQ and BBUSREQ; AHOLDA and BHOLDA (when the corresponding HOLD input is low)

Low group consists of: XSP_CS, CLKX2/XSP_CLK, and DX2/XSP_DO; all of which apply only when PCI EEPROM (BEA13) is enabled (with PCI_EN = 1 and MCBSP2_EN = 0). Otherwise, the CLKX2/XSP_CLK and DX2/XSP_DO pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.

Z group consists of: HD[31:0]/AD[31:0], CLKX0, CLKX1/URADDR4, CLKX2/XSP_CLK, FSX0, FSX1/UXADDR3, FSX2, DX0, DX1/UXADDR4, DX2/XSP_DO, CLKR0, CLKR1/URADDR2, CLKR2, FSR0, FSR1/UXADDR2, FSR2, TOUT0, TOUT1, TOUT2, GP[8:0], GP10/PCBE3, HR/W/PCBE2, HDS2/PCBE1, PCBE0, GP13/PINTA, GP11/PREQ, HDS1/PSERR, HCS/PPERR, HCNTL1/PDEVSEL, HAS/PPAR, HCNTL0/PSTOP, HHWIL/PTRDY (16-bit HPI mode only), HRDY/PIRDY, HINT/PFRAME, UXDATA[7:0], UXSOC, UXCLAV, and URCLAV.

§ If BEA[20:13, 11, 7] and HD5/AD5 pins are actively driven, care must be taken to ensure no timing contention between parameters 6, 7, 14, 15, 16, and 17.

¶ Boot and Device Configurations Inputs (during reset) include: EMIFB address pins BEA[20:13, 11, 9:7] and HD5/AD5.

The PCI_EN pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.

The MCBSP2_EN pin *must* be driven valid at all times and the user *can* switch values throughout device operation.

Figure 37. Reset Timing†

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

EXTERNAL INTERRUPT TIMING

timing requirements for external interrupts† (see Figure 38)

| NO. | | | -600 | UNIT |
|-----|--------------|---|------|------|
| | | | -720 | |
| | | | MIN | MAX |
| 1 | $t_w(ILOW)$ | Width of the NMI interrupt pulse low | 4P | ns |
| | | Width of the EXT_INT interrupt pulse low | 8P | ns |
| 2 | $t_w(IHIGH)$ | Width of the NMI interrupt pulse high | 4P | ns |
| | | Width of the EXT_INT interrupt pulse high | 8P | ns |

† P = 1/CPU clock frequency in ns. For example, when running parts at 720 MHz, use P = 1.39 ns.

Figure 38. External/NMI Interrupt Timing

HOST-PORT INTERFACE (HPI) TIMING

timing requirements for host-port interface cycles^{†‡} (see Figure 39 through Figure 46)

| NO. | | | -600 -850 -720 -1G | | UNIT |
|-----|-----------------------------|--|-----------------------------|-----|------|
| | | | MIN | MAX | |
| 1 | $t_{su}(\text{SELV-HSTBL})$ | Setup time, select signals \S valid before $\overline{\text{HSTROBE}}$ low | 5 | | ns |
| 2 | $t_h(\text{HSTBL-SELV})$ | Hold time, select signals \S valid after $\overline{\text{HSTROBE}}$ low | 2.4 | | ns |
| 3 | $t_w(\text{HSTBL})$ | Pulse duration, $\overline{\text{HSTROBE}}$ low | 4P [¶] | | ns |
| 4 | $t_w(\text{HSTBH})$ | Pulse duration, $\overline{\text{HSTROBE}}$ high between consecutive accesses | 4P | | ns |
| 10 | $t_{su}(\text{SELV-HASL})$ | Setup time, select signals \S valid before $\overline{\text{HAS}}$ low | 5 | | ns |
| 11 | $t_h(\text{HASL-SELV})$ | Hold time, select signals \S valid after $\overline{\text{HAS}}$ low | 2 | | ns |
| 12 | $t_{su}(\text{HDV-HSTBH})$ | Setup time, host data valid before $\overline{\text{HSTROBE}}$ high | 5 | | ns |
| 13 | $t_h(\text{HSTBH-HDV})$ | Hold time, host data valid after $\overline{\text{HSTROBE}}$ high | 2.8 | | ns |
| 14 | $t_h(\text{HRDYL-HSTBL})$ | Hold time, $\overline{\text{HSTROBE}}$ low after $\overline{\text{HRDY}}$ low. $\overline{\text{HSTROBE}}$ should not be inactivated until $\overline{\text{HRDY}}$ is active (low); otherwise, HPI writes will not complete properly. | 2 | | ns |
| 18 | $t_{su}(\text{HASL-HSTBL})$ | Setup time, $\overline{\text{HAS}}$ low before $\overline{\text{HSTROBE}}$ low | 2 | | ns |
| 19 | $t_h(\text{HSTBL-HASL})$ | Hold time, $\overline{\text{HAS}}$ low after $\overline{\text{HSTROBE}}$ low | 2.1 | | ns |

[†] $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

[‡] $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 720 MHz, use $P = 1.39$ ns.

[§] Select signals include: $\overline{\text{HCNTL}}[1:0]$ and $\overline{\text{HR/W}}$. For HPI16 mode only, select signals also include $\overline{\text{HHWL}}$.

[¶] Select the parameter value of 4P or 12.5 ns, whichever is greater.

switching characteristics over recommended operating conditions during host-port interface cycles^{†‡} (see Figure 39 through Figure 46)

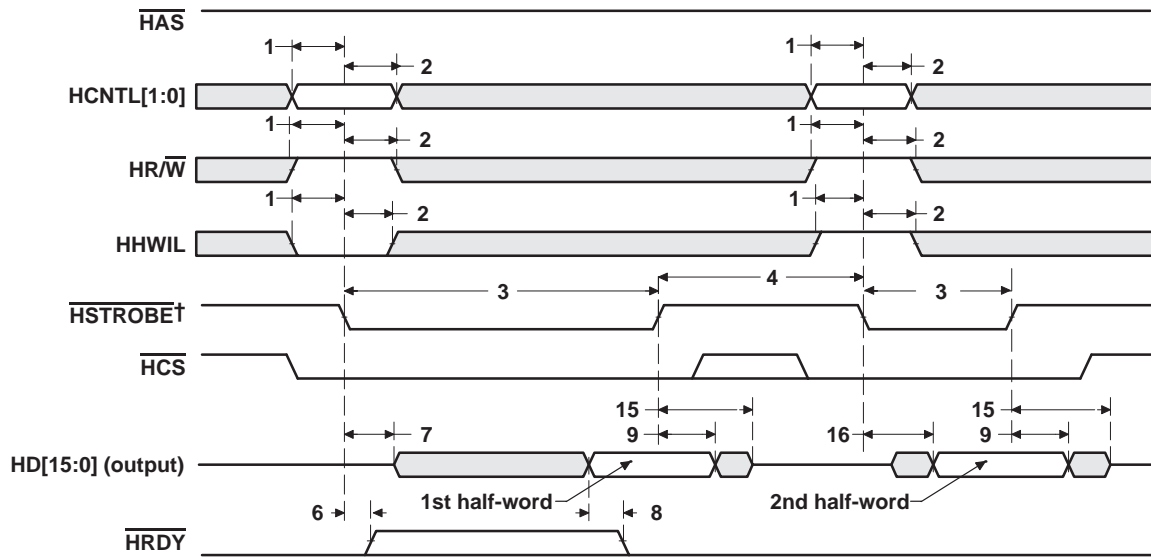

| NO. | PARAMETER | | -600 -850 -720 -1G | | UNIT |
|-----|----------------------------|---|-----------------------------|--------|------|
| | | | MIN | MAX | |
| 6 | $t_d(\text{HSTBL-HRDYH})$ | Delay time, $\overline{\text{HSTROBE}}$ low to $\overline{\text{HRDY}}$ high [#] | 1.3 | 4P + 8 | ns |
| 7 | $t_d(\text{HSTBL-HDLZ})$ | Delay time, $\overline{\text{HSTROBE}}$ low to HD low impedance for an HPI read | 2 | | ns |
| 8 | $t_d(\text{HDV-HRDYL})$ | Delay time, HD valid to $\overline{\text{HRDY}}$ low | -3 | | ns |
| 9 | $t_{oh}(\text{HSTBH-HDV})$ | Output hold time, HD valid after $\overline{\text{HSTROBE}}$ high | 1.5 | | ns |
| 15 | $t_d(\text{HSTBH-HDZH})$ | Delay time, $\overline{\text{HSTROBE}}$ high to HD high impedance | | 12 | ns |
| 16 | $t_d(\text{HSTBL-HDV})$ | Delay time, $\overline{\text{HSTROBE}}$ low to HD valid (HPI16 mode, 2nd half-word only) | | 4P + 8 | ns |

[†] $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

[‡] $P = 1/\text{CPU clock frequency}$ in ns. For example, when running parts at 720 MHz, use $P = 1.39$ ns.

[#] This parameter is used during HPID reads and writes. For reads, at the beginning of a word transfer (HPI32) or the first half-word transfer (HPI16) on the falling edge of $\overline{\text{HSTROBE}}$, the HPI sends the request to the EDMA internal address generation hardware, and $\overline{\text{HRDY}}$ remains high until the EDMA internal address generation hardware loads the requested data into HPID. For writes, $\overline{\text{HRDY}}$ goes high if the internal write buffer is full.

HOST-PORT INTERFACE (HPI) TIMING (CONTINUED)

† $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.

MULTICHANNEL BUFFERED SERIAL PORT (McBSP) TIMING

timing requirements for McBSP[†] (see Figure 51)

| NO. | | | | -600 -720 -850 -1G | UNIT |
|-----|---------------------------|---|------------|---|------|
| | | | | MIN | |
| 2 | $t_c(\text{CKRX})$ | Cycle time, CLKR/X | CLKR/X ext | 4P or 6.67 [‡] §¶ | ns |
| 3 | $t_w(\text{CKRX})$ | Pulse duration, CLKR/X high or CLKR/X low | CLKR/X ext | 0.5 $t_c(\text{CKRX}) - 1$ [#] | ns |
| 5 | $t_{su}(\text{FRH-CKRL})$ | Setup time, external FSR high before CLKR low | CLKR int | 9 | ns |
| | | | CLKR ext | 1.3 | |
| 6 | $t_h(\text{CKRL-FRH})$ | Hold time, external FSR high after CLKR low | CLKR int | 6 | ns |
| | | | CLKR ext | 3 | |
| 7 | $t_{su}(\text{DRV-CKRL})$ | Setup time, DR valid before CLKR low | CLKR int | 8 | ns |
| | | | CLKR ext | 0.9 | |
| 8 | $t_h(\text{CKRL-DRV})$ | Hold time, DR valid after CLKR low | CLKR int | 3 | ns |
| | | | CLKR ext | 3.1 | |
| 10 | $t_{su}(\text{FXH-CKXL})$ | Setup time, external FSX high before CLKX low | CLKX int | 9 | ns |
| | | | CLKX ext | 1.3 | |
| 11 | $t_h(\text{CKXL-FXH})$ | Hold time, external FSX high after CLKX low | CLKX int | 6 | ns |
| | | | CLKX ext | 3 | |

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
[‡] Minimum CLKR/X cycle times *must* be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
[§] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.
[¶] Use whichever value is greater.
[#] This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

MULTICHANNEL BUFFERED SERIAL PORT (McBSP) TIMING (CONTINUED)

switching characteristics over recommended operating conditions for McBSP^{†‡} (see Figure 51)

| NO. | PARAMETER | | -600 -720 -850 -1G | | UNIT |
|-----|-----------------------------|--|-----------------------------|---------------------------|----------------|
| | | | MIN | MAX | |
| 1 | $t_d(\text{CKSH-CKRXH})$ | Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input | 1.4 | 10 | ns |
| 2 | $t_c(\text{CKRX})$ | Cycle time, CLKR/X | CLKR/X int | 4P or $6.67\frac{S}{P}\#$ | ns |
| 3 | $t_w(\text{CKRX})$ | Pulse duration, CLKR/X high or CLKR/X low | CLKR/X int | C - 1 C + 1 | ns |
| 4 | $t_d(\text{CKRH-FRV})$ | Delay time, CLKR high to internal FSR valid | CLKR int | -2.1 | 3 |
| 9 | $t_d(\text{CKXH-FXV})$ | Delay time, CLKX high to internal FSX valid | CLKX int | -1.7 | 3 |
| | | | CLKX ext | 1.7 | 9 |
| 12 | $t_{dis}(\text{CKXH-DXHZ})$ | Disable time, DX high impedance following last data bit from CLKX high | CLKX int | -3.9 | 4 |
| | | | CLKX ext | 2 | 9 |
| 13 | $t_d(\text{CKXH-DXV})$ | Delay time, CLKX high to DX valid | CLKX int | $-3.9 + D1\star$ | $4 + D2\star$ |
| | | | CLKX ext | $2.0 + D1\star$ | $9 + D2\star$ |
| 14 | $t_d(\text{FXH-DXV})$ | Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode | FSX int | $-2.3 + D1\Box$ | $5.6 + D2\Box$ |
| | | | FSX ext | $1.9 + D1\Box$ | $9 + D2\Box$ |

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

[‡] Minimum delay times also represent minimum output hold times.

[§] Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.

[¶] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[#] Use whichever value is greater.

^{||} C = H or L

S = sample rate generator input clock = 4P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

H = CLKX high pulse width = $(\text{CLKGDV}/2 + 1) * S$ if CLKGDV is even

= $(\text{CLKGDV} + 1)/2 * S$ if CLKGDV is odd or zero

L = CLKX low pulse width = $(\text{CLKGDV}/2) * S$ if CLKGDV is even

= $(\text{CLKGDV} + 1)/2 * S$ if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see [¶] footnote above).

[☆] Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

if DXENA = 0, then D1 = D2 = 0

if DXENA = 1, then D1 = 4P, D2 = 8P

[□] Extra delay from FSX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.

if DXENA = 0, then D1 = D2 = 0

if DXENA = 1, then D1 = 4P, D2 = 8P

MULTICHANNEL BUFFERED SERIAL PORT (McBSP) TIMING (CONTINUED)

† Parameter No. 13 applies to the first data bit *only* when XDATDLY ≠ 0

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

GENERAL-PURPOSE INPUT/OUTPUT (GPIO) PORT TIMING

timing requirements for GPIO inputs^{†‡} (see Figure 62)

| NO. | | | -600 | -720 | -850 | -1G | UNIT |
|-----|---------------------|---------------------------|------|------|------|-----|------|
| | | | MIN | MAX | | | |
| 1 | $t_w(\text{GPIH})$ | Pulse duration, GPIx high | 8P | | | | ns |
| 2 | $t_w(\text{GPI L})$ | Pulse duration, GPIx low | 8P | | | | ns |

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 720 MHz, use P = 1.39 ns.

[‡] The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 12P to allow the DSP enough time to access the GPIO register through the CFGBUS.

switching characteristics over recommended operating conditions for GPIO outputs[†] (see Figure 62)

| NO. | PARAMETER | -600 | -720 | -850 | -1G | UNIT |
|-----|--------------------|------|----------------|------|-----|------|
| | | MIN | MAX | | | |
| 3 | $t_w(\text{GPOH})$ | 24P | 8 [§] | | | ns |
| 4 | $t_w(\text{GPOL})$ | 24P | 8 [§] | | | ns |

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 720 MHz, use P = 1.39 ns.

[§] This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.

Figure 62. GPIO Port Timing

JTAG TEST-PORT TIMING

timing requirements for JTAG test port (see Figure 63)

| NO. | | -600 -720 -850 -1G | | UNIT |
|-----|--|-----------------------------|-----|------|
| | | MIN | MAX | |
| 1 | $t_c(\text{TCK})$ Cycle time, TCK | 35 | | ns |
| 3 | $t_{su}(\text{TDIV-TCKH})$ Setup time, TDI/TMS/ $\overline{\text{TRST}}$ valid before TCK high | 10 | | ns |
| 4 | $t_h(\text{TCKH-TDIV})$ Hold time, TDI/TMS/ $\overline{\text{TRST}}$ valid after TCK high | 9 | | ns |

switching characteristics over recommended operating conditions for JTAG test port (see Figure 63)

| NO. | PARAMETER | -600 -720 -850 -1G | | UNIT |
|-----|--|-----------------------------|-----|------|
| | | MIN | MAX | |
| 2 | $t_d(\text{TCKL-TDOV})$ Delay time, TCK low to TDO valid | 0 | 18 | ns |

SPRS226M – NOVEMBER 2003 – REVISED APRIL 2009

MECHANICAL DATA FOR C6414T, C6415T, AND C6416T

The following table(s) show the thermal resistance characteristics for the PBGA — GLZ, ZLZ and CLZ mechanical packages.

thermal resistance characteristics (S-PBGA package) [GLZ]

| NO. | | Air Flow (m/s†) | °C/W‡ | °C/W (with Heat Sink§) |
|-----|---|-----------------|-------|---------------------------|
| 1 | R θ _{JC} Junction-to-case | N/A | 3.11 | 3.11 |
| 2 | R θ _{JB} Junction-to-board | N/A | 9.95 | 9.95 |
| 3 | R θ _{JA} Junction-to-free air | 0.00 | 19.6 | 14.4 |
| 4 | R θ _{JA} Junction-to-free air | 0.5 | 17.3 | 11.5 |
| 5 | R θ _{JA} Junction-to-free air | 1.0 | 15.6 | 9.3 |
| 6 | R θ _{JA} Junction-to-free air | 2.00 | 14.7 | 8.0 |
| 7 | Psi _{JT} Junction-to-package top | N/A | 0.83 | 0.83 |
| 8 | Psi _{JB} Junction-to-board | N/A | 7.88 | 7.88 |

† m/s = meters per second

‡ Numbers are based on simulations.

§ These thermal resistance numbers were modeled using a heat sink, part number 374024B00035, manufactured by AAVID Thermalloy. AAVID Thermalloy also manufactures a similar epoxy-mounted heat sink, part number 374024B00000. **When operating at 1 GHz, a heat sink is required to reduce the thermal resistance characteristics of the package.** TI recommends a passive, laminar heat sink, similar to the part numbers mentioned above.

| | | | | | | | | | | @2003 TI A8 4 | |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
