

Up to 8.0Gbps Dual Passive Switches

General Description

The MAX4888B/MAX4888C dual double-pole/double-throw (2 x DPDT), high-speed passive switches are ideal for switching two half-lanes of PCI Express® (PCIe) data between two possible destinations. These devices feature a dual digital control input to switch signal paths. The MAX4888C is intended for use in systems where both the input and output are capacitively coupled (e.g., SAS, SATA, XAUI, and PCIe) and provides a 10 μ A (typ) source current and a 60k Ω (typ) internal biasing resistor to GND at the AOUT_ and BOUT_ pins.

The devices are fully specified to operate from a single +3.3V (typ) power supply. Both devices are available in an industry-standard 3.5mm x 5.5mm, 28-pin TQFN package. They operate over the -40°C to +85°C extended temperature range.

Applications

Desktop PCs
Notebook PCs
Servers

Features

- ◆ Single +3.3V Power-Supply Voltage
- ◆ Supports PCIe Gen I, Gen II, and Gen III Data Rates
- ◆ Supports Up To and Including 6.0Gbps SAS/SATA Signals
- ◆ Supports Other High-Speed Interfaces (e.g., XAUI)
- ◆ Superior Bandwidth Return Loss
- ◆ Small, 3.5mm x 5.5mm, 28-Pin TQFN Package

Note 2: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

MAX4888B/MAX4888C

Detailed Description

The MAX4888B high-speed passive switch routes high-speed differential signals such as PCIe, SAS, SATA, and XAUI from one source to two possible destinations or vice versa. The MAX4888B is ideal for routing PCIe signals to change the system configuration. The MAX4888C features a 10 μ A (typ) source current and a 60k Ω (typ) internal biasing resistor to GND at the AOUTA_, BOUTA_, AOUTB_, and BOUTB_ terminals. The MAX4888C is ideal for circuits that are capacitively coupled at both the output and input. These devices are protocol independent and can be used to switch two different protocol signals over the same physical lane. They feature dual digital control inputs (SEL, SELB) to switch signal paths. SEL has a 70k Ω (typ) pulldown resistor to GND and SELB has a 70k Ω (typ) pullup resistor to VCC.

These devices are fully specified to operate from a single 3.0V to 3.6V power supply.

Digital Control Input (SEL, SELB)

The devices provide dual digital control inputs (SEL, SELB) to select the signal path between the AIN_, BIN_ and AOUTA_, BOUTA_ or AOUTB_, BOUTB_ channels. In most cases SEL is chosen and SELB is unconnected. The truth table for the devices is depicted in the *Functional Diagram/Truth Table*. SEL has a 70k Ω (typ) pulldown resistor to GND and SELB has a 70k Ω (typ) pullup resistor to VCC.

Analog-Signal Levels

The devices accept signals from -0.3V to (VCC - 1.8V). Signals on the AIN+ and BIN+ channels are routed to either the AOUTA+, BOUTA+ or AOUTB+, BOUTB+ channels. Signals on the AIN- and BIN- channels are routed to either the AOUTA-, BOUTA- or AOUTB-, BOUTB- channels. The devices are bidirectional switches, allowing AIN_, BIN_ and AOUTA_, BOUTA_, AOUTB_, and BOUTB_ to be used as either inputs or outputs.

Applications Information

High-Speed Switching

The devices' primary applications are aimed at sharing resources. For example, a single lane of PCIe or SAS can be shared between a single host and two devices. This could be used for redundancy or to share resources such as a physical lane or route a lane between one host and two devices or two hosts and one device.

Board Layout

High-speed switches require proper layout and design procedures for optimum performance. Keep controlled impedance PCB traces as short as possible or follow impedance layouts per the PCIe specification. Ensure that power-supply bypass capacitors are placed as close as possible to the device. Multiple bypass capacitors are recommended. Connect all grounds and the exposed pad to a large ground plane.
