

**THE DATASHEET OF
LT1102CN8#PBF**

High Speed, Precision, JFET Input Instrumentation Amplifier (Fixed Gain = 10 or 100)

FEATURES

- Slew Rate: 30V/μs
- Gain-Bandwidth Product: 35MHz
- Settling Time (0.01%): 3μs
- Overdrive Recovery: 0.4μs
- Gain Error: 0.05% Max
- Gain Drift: 5ppm/°C
- Gain Nonlinearity: 16ppm Max
- Offset Voltage (Input + Output): 600μV Max
– Drift with Temperature: 2μV/°C
- Input Bias Current: 40pA Max
- Input Offset Current: 40pA Max
– Drift with Temperature (to 70°C): 0.5pA/°C

APPLICATIONS

- Fast Settling Analog Signal Processing
- Multiplexed Input Data Acquisition Systems
- High Source Impedance Signal Amplification from High Resistance Bridges, Capacitance Sensors, Photodetector Sensors
- Bridge Amplifier with < 1Hz Lowpass Filtering

DESCRIPTION

The LT[®]1102 is the first fast FET input instrumentation amplifier offered in the low cost, space saving 8-pin packages. Fixed gains of 10 and 100 are provided with excellent gain accuracy (0.01%) and non-linearity (3ppm). No external gain setting resistor is required.

Slew rate, settling time, gain-bandwidth product, overdrive recovery time are all improved compared to competitive high speed instrumentation amplifiers.

Industry best speed performance is combined with impressive precision specifications: less than 10pA input bias and offset currents, 180μV offset voltage. Unlike other FET input instrumentation amplifiers, on the LT1102 there is no output offset voltage contribution to total error, and input bias currents do not double with every 10°C rise in temperature. Indeed, at 70°C ambient temperature the input bias current is only 40pA.

LT, LT, LTC and LTM are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

**Wideband Instrumentation Amplifier
with ±150mA Output Current**

Slew Rate

LT1102

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage $\pm 20\text{V}$
 Differential Input Voltage $\pm 40\text{V}$
 Input Voltage $\pm 20\text{V}$

Output Short-Circuit Duration Indefinite
 Operating Temperature Range
 LT1102I -40°C to 85°C
 LT1102AC/LT1102C 0°C to 70°C
 LT1102AM/LT1102M (**OBSELETE**)..... -55°C to 125°C
 Storage Temperature Range -65°C to 150°C
 Lead Temperature (Soldering, 10 sec) 300°C

Order Options Tape and Reel: Add #TR
 Lead Free: Add #PBF Lead Free Tape and Reel: Add #TRPBF

ELECTRICAL CHARACTERISTICS

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: This parameter is tested on a sample basis only.

Note 3: Current noise is calculated from the formula:

$$i_n = (2qI_B)^{1/2}$$

where $q = 1.6 \cdot 10^{-19}$ coulomb. The noise of source resistors up to $1G\Omega$ swamps the contribution of current noise.

Note 4: This parameter is not tested. It is guaranteed by design and by inference from the slew rate measurement.

Note 5: Overdrive recovery is defined as the time delay from the removal of an input overdrive to the output's return from saturation to linear operation.

50% overdrive equals $V_{IN} = \pm 2V$ ($G = 10$) or $V_{IN} = \pm 200mV$ ($G = 100$).

Note 6: This parameter is not tested. It is guaranteed by design and by inference from other tests.

TYPICAL PERFORMANCE CHARACTERISTICS

Small Signal Response, $G = 10$
(Input = 50mV Pulse)

Small Signal Response, $G = 100$
(Input = 5mV Pulse)

Slew Rate, $G = 100$
(Input = $\pm 130mV$ Pulse)

Settling Time, $G = 10$
(Input From $-10V$ to $10V$)

Settling Time, $G = 10$
(Input From $10V$ to $-10V$)

Settling Time, $G = 100$
(Input From $-10V$ to $10V$)

Settling Time, $G = 100$
(Input From $10V$ to $-10V$)

APPLICATIONS INFORMATION

In the two op amp instrumentation amplifier configuration, the first amplifier is basically in unity gain, and the second amplifier provides all the voltage gain. In the LT1102, the second amplifier is decompensated for gain of 10 stability, therefore high slew rate and bandwidth are achieved. Common mode rejection versus frequency is also optimized in the G = 10 mode, because the bandwidths of the two op amps are similar. When G = 100, this statement is no longer true; however, by connecting an 18pF capacitor between pins 1 and 2, a common mode AC gain is created to cancel the inherent roll-off. From 200Hz to 30kHz, CMRR versus frequency is improved by an order of magnitude.

Input Protection

Instrumentation amplifiers are often used in harsh environments where overload conditions can occur. The LT1102 employs FET input transistors, consequently the differential input voltage can be ±30V (with ±15V supplies, ±36V with ±18V supplies). Some competitive instrumentation amplifiers have NPN inputs which are protected by back-to-back diodes. When the differential input Voltage exceeds ±13V on these competitive devices, input current increases to milliampere level; more than ±10V differential voltage can cause permanent damage.

When the LT1102 inputs are pulled below the negative supply or above the positive supply, the inputs will clamp a diode voltage below or above the supplies. No damage will occur if the input current is limited to 20mA.

Common Mode Rejection Ratio vs Frequency

LT1102 • A101

Gains Between 10 and 100

Gains between 10 and 100 can be achieved by connecting two equal resistors (= R_X) between pins 1 and 2 and pins 7 and 8.

$$\text{Gain} = 10 + \frac{R_X}{R + R_X/90}$$

The nominal value of R is 1.84kΩ. The usefulness of this method is limited by the fact that R is not controlled to better than ±10% absolute accuracy in production. However, on any specific unit, 90R can be measured between Pins 1 and 2.

APPLICATIONS INFORMATION

Gain = 20, 110, or 200 Instrumentation Amplifiers

Differential Output

Single Ended Output

GAIN = 200, AS SHOWN
 GAIN = 20, SHORT PIN 1 TO PIN 2, PIN 7 TO PIN 8 ON BOTH DEVICES
 GAIN = 110, SHORT PIN 1 TO PIN 2, PIN 7 TO PIN 8 ON ONE DEVICE,
 NOT ON THE OTHER
 INPUT REFERRED NOISE IS REDUCED BY $\sqrt{2}$ (G = 200 OR 20)
