

**THE DATASHEET OF
MAX6842FUKD0+T**

Ultra-Low-Voltage μ P Reset Circuits and Voltage Detectors

MAX6841-MAX6845

General Description

The MAX6841-MAX6845 microprocessor (μ P) supervisory circuits monitor ultra-low-voltage power supplies in μ P and digital systems. They provide excellent circuit reliability at low cost by eliminating external components and adjustments when used with +0.9V to +1.5V systems. Factory-trimmed reset thresholds are available for the MAX6841/MAX6842. The MAX6843/MAX6844/MAX6845 provide a RESET IN input, allowing the user to externally adjust the reset threshold. The MAX6841-MAX6845 family features a debounced manual reset input (MR). The reset comparator is designed to ignore fast transients on VCC.

The MAX6841-MAX6845 assert a reset signal whenever the VCC supply voltage declines below a preset or adjustable threshold or whenever manual reset (MR) is asserted. Reset remains asserted for a fixed timeout delay after VCC has risen above the reset threshold and when manual reset is deasserted. Five timeout periods are available for each part: 150 μ s (voltage detector version), 1.5ms, 30ms, 210ms, and 1.68s (typ).

The MAX6841/MAX6843 have an active-low push-pull reset output. The MAX6841/MAX6842/MAX6844 have an active-high push-pull reset output, and the MAX6842/MAX6845 have an active-low open-drain reset output. The active-low open-drain reset output requires a pullup resistor that can be connected to a voltage from 0 to VCC.

The low supply current (5.7 μ A) and small package (SOT23-5) make the MAX6841-MAX6845 ideal for use in portable equipment.

Applications

Computers
 Controllers
 Intelligent Instruments
 Critical μ P and μ C Power Monitoring
 Portable/Battery-Powered Equipment
 Telecom/Networking Equipment
 Basestations
 Servers/Workstations

Selector Guide and Typical Operating Circuit appear at end of data sheet.

Features

- ◆ **Factory-Set Reset Threshold Voltages for Monitoring Supplies from 0.9V to 1.5V (MAX6841/MAX6842)**
- ◆ **Adjustable Threshold RESET IN (MAX6843/MAX6844/MAX6845)**
- ◆ **Low Power Consumption: 5.7 μ A (typ)**
- ◆ **\pm 2.5% Reset Threshold Accuracy Over Temperature**
- ◆ **Five Timeout Periods: 150 μ s (Voltage Detector Version), 1.5ms, 30ms, 210ms, and 1.68s**
- ◆ **Available in Three Output Configurations**
 Push-Pull RESET
 Push-Pull RESET
 Open-Drain RESET
- ◆ **Guaranteed Reset Valid to VCC = 0.55V (Active Low)**
- ◆ **Manual Reset Input**
- ◆ **Immune to Short VCC Transients**
- ◆ **Space-Saving 5-Pin SOT23 Package**

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX6841_UKD_-T	-40°C to +85°C	5 SOT23-5
MAX6842_UKD_-T	-40°C to +85°C	5 SOT23-5
MAX6843UKD_-T	-40°C to +85°C	5 SOT23-5
MAX6844UKD_-T	-40°C to +85°C	5 SOT23-5
MAX6845UKD_-T	-40°C to +85°C	5 SOT23-5

Note: Insert desired suffix letter (from the Threshold Suffix Guide and the Active Timeout Period tables) into the blanks to complete the part number. For example, the MAX6842GUKD1 has a reset threshold of 1.11V and a typical reset timeout period of 1.5ms. Sample stock is generally available on standard versions only (see the Standard Versions table). Standard versions require a minimum order increment of 2.5k units. Nonstandard versions must be ordered in 10k-unit increments. Contact factory for availability. All parts are offered in tape-and-reel only.

Devices are available in both leaded and lead-free packaging. Specify lead-free by replacing "-T" with "+T" when ordering.

Pin Configurations

Ultra-Low-Voltage μP Reset Circuits and Voltage Detectors

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)

$\overline{\text{VCC}}$	-0.3V to +6V
$\overline{\text{MR}}$, RESET IN, $\overline{\text{RESET}}$ (open-drain).....	-0.3V to +6V
Push-Pull $\overline{\text{RESET}}$ and RESET	-0.3V to ($\text{VCC} + 0.3\text{V}$)
Input Current (all pins)	20mA
Output Current (RESET, $\overline{\text{RESET}}$).....	20mA

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)

5-Pin SOT23 (derate 7.1mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$).....	571mW
Operating Temperature Range	-40°C to $+85^\circ\text{C}$
Junction Temperature	$+150^\circ\text{C}$
Storage Temperature Range	-65°C to $+150^\circ\text{C}$
Lead Temperature (soldering, 10s).....	$+300^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($\text{VCC} = +0.55\text{V}$ to $+1.8\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage Range	VCC	MAX6843/MAX6845	0.55		1.80	V
		MAX6841/MAX6842/MAX6844 (Note 2)	0.75		1.80	
Supply Current	ICC	$\text{VCC} = 0.9\text{V}$, no load, reset not asserted		5.7	20	μA
		$\text{VCC} = 1.5\text{V}$, no load, reset not asserted		7.3	20

Ultra-Low-Voltage μP Reset Circuits and Voltage Detectors

MAX6841-MAX6845

ELECTRICAL CHARACTERISTICS (continued)

($V_{CC} = +0.55\text{V}$ to $+1.8\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Open-Drain $\overline{\text{RESET}}$ Output Voltage	V_{OL}	$V_{CC} \geq 0.55\text{V}$, $I_{SINK} = 10\mu\text{A}$, reset asserted			$0.2 \times V_{CC}$	V
		$V_{CC} \geq 0.83\text{V}$, $I_{SINK} = 80\mu\text{A}$, reset asserted			$0.2 \times V_{CC}$	
Open-Drain $\overline{\text{RESET}}$ Output Leakage Current	I_{LKG}	$V_{CC} > V_{TH}$, reset not asserted			1	μA
Push-Pull $\overline{\text{RESET}}$ Output Voltage	V_{OL}	$V_{CC} \geq 0.55\text{V}$, $I_{SINK} = 10\mu\text{A}$, reset asserted			$0.2 \times V_{CC}$	V
	V_{OL}	$V_{CC} \geq 0.83\text{V}$, $I_{SINK} = 80\mu\text{A}$, reset asserted			$0.2 \times V_{CC}$	
Push-Pull $\overline{\text{RESET}}$ Output Voltage	V_{OH}	$V_{CC} \geq 0.83\text{V}$, $I_{SOURCE} = 40\mu\text{A}$, reset not asserted	$0.8 \times V_{CC}$			V
	V_{OH}	$V_{CC} \geq 0.75\text{V}$, $I_{SOURCE} = 10\mu\text{A}$, reset asserted	$0.8 \times V_{CC}$			
Push-Pull $\overline{\text{RESET}}$ Output Voltage	V_{OH}	$V_{CC} \geq 0.83\text{V}$, $I_{SOURCE} = 40\mu\text{A}$, reset asserted	$0.8 \times V_{CC}$			V
	V_{OL}	$V_{CC} \geq 0.83\text{V}$, $I_{SINK} = 80\mu\text{A}$, reset not asserted			$0.2 \times V_{CC}$	

Note 1: 100% production tested at $+25^\circ\text{C}$. Overtemperature limits are guaranteed by design.

Note 2: The active-low output $\overline{\text{RESET}}$ has $V_{CC(MIN)} = 0.55\text{V}$ (MAX6841/MAX6842).

Note 3: For $V_{CC} > 0.788\text{V}$, $T_A = 0^\circ\text{C}$ to $+85^\circ\text{C}$, and for $V_{CC} > 0.833\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$.

Typical Operating Characteristics

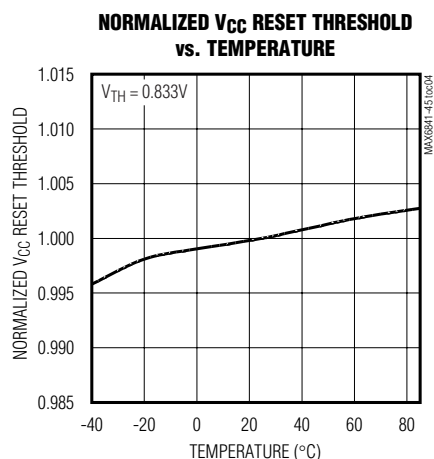

($V_{CC} = 1.5\text{V}$, $T_A = +25^\circ\text{C}$, unless otherwise noted.)

Ultra-Low-Voltage μ P Reset Circuits and Voltage Detectors

Typical Operating Characteristics (continued)

($V_{CC} = 1.5V$, $T_A = +25^\circ C$, unless otherwise noted.)

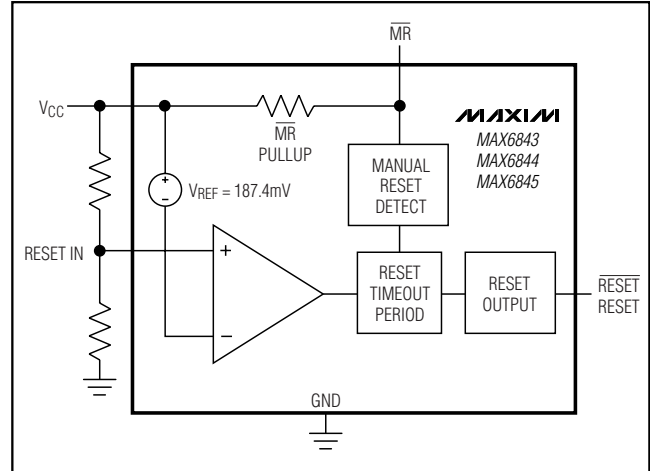

Pin Description

PIN			NAME	FUNCTION
MAX6841 MAX6842	MAX6843 MAX6845	MAX6844		
1	—	—	\overline{RESET}	Push-Pull (MAX6841) or Open-Drain (MAX6842) Active-Low Reset Output. \overline{RESET} changes from high to low when V_{CC} drops below the selected reset threshold or \overline{MR} is pulled low. \overline{RESET} remains low for the reset timeout period after V_{CC} exceeds the device reset threshold and \overline{MR} is released high.
—	1	—	\overline{RESET}	Push-Pull (MAX6843) or Open-Drain (MAX6845) Active-Low Reset Output. \overline{RESET} changes from high to low when $RESET\ IN$ drops below the 187.4mV reset threshold (referenced to V_{CC}) or \overline{MR} is pulled low. \overline{RESET} remains low for the reset timeout period after $RESET\ IN$ exceeds the reset threshold and \overline{MR} is released high.
2	2	2	GND	Ground
3	—	—	RESET	Push-Pull Active-High Reset Output. $RESET$ changes from low to high when V_{CC} input drops below the selected reset threshold or \overline{MR} is pulled low. $RESET$ remains high for the reset timeout period after V_{CC} exceeds the device reset threshold and \overline{MR} is released high.
—	—	1		Push-Pull Active-High Reset Output. $RESET$ changes from low to high when the $RESET\ IN$ input drops below the 187.4mV reset threshold (referenced to V_{CC}). $RESET$ remains high for the reset timeout period after $RESET\ IN$ exceeds the reset threshold.
—	3	3	RESET IN	Adjustable Reset Input. High-impedance input for reset comparator. Connect this pin to an external resistive-divider network to set the reset threshold voltage; the typical threshold is 187.4mV (referenced to V_{CC}). The MAX6843/MAX6844/MAX6845 assert a reset signal when the V_{CC} to $RESET\ IN$ differential falls below its threshold voltage.
4	4	4	\overline{MR}	Active-Low Manual Reset Input. Internal 20k Ω pullup to V_{CC} . Pull low to force a reset. Reset remains active as long as \overline{MR} is low and for the reset timeout period after \overline{MR} goes high. Leave unconnected or connect to V_{CC} if unused.
5	5	5	V_{CC}	Supply Voltage. Monitored supply for the MAX6841/MAX6842.

Ultra-Low-Voltage μP Reset Circuits and Voltage Detectors

Functional Diagrams

MAX6841-MAX6845

Detailed Description

Reset Output

A microprocessor's (μP 's) reset input starts the μP in a known state. The MAX6841-MAX6845 assert a reset during power-up, power-down, and brownout conditions. When the V_{CC} supply voltage falls below a preset threshold (MAX6841/MAX6842) or RESET IN falls below the adjustable threshold (MAX6843/MAX6844/MAX6845), reset asserts and stays asserted for a fixed timeout delay (Table 2) after V_{CC} or RESET IN has risen above the reset threshold. The MAX6841-MAX6845 are available with five typical timeout options for each part: 150 μs (voltage detector), 1.5ms, 30ms, 210ms, and 1.68s.

The MAX6841/MAX6842 have two reset outputs (RESET and RESET); one is the inverse of the other. The MAX6841 has one active-high push-pull output and one active-low push-pull output. The MAX6842 has one active-high push-pull output and one active-low open-drain output. The MAX6843 features an active-low push-pull output. The MAX6844 features an active-high push-pull output, and the MAX6845 has an active-low open-drain output stage. Connect a pullup resistor from the open-drain RESET output to any voltage between 0 and 6V.

Manual Reset Input

Many μP -based systems require a manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. Reset remains asserted while MR is low, and for a fixed timeout delay after MR returns high. This input has an internal 20k Ω pullup resistor, so it can be left open if it is not used. MR can be driven with CMOS logic level or with open-drain/collector outputs. To create a manual reset func-

tion, connect a normally open momentary switch from MR to ground; external debounce circuitry is not required. If MR is driven from long cables or the device is used in a noisy environment, connect a 0.1 μF capacitor from MR to ground to provide additional noise immunity.

RESET IN

The MAX6843/MAX6844/MAX6845 feature a RESET IN input, which allows users to adjust the reset threshold voltage. The internal reference voltage is 187.4mV with respect to V_{CC} . An external resistive-divider network can be used to set voltage monitoring thresholds, as shown in Figure 1. The resistive-divider network must be referenced to V_{CC} . As V_{CC} falls, the voltage at

Figure 1. Setting the Adjustable Threshold Externally

Ultra-Low-Voltage μP Reset Circuits and Voltage Detectors

RESET IN decreases. The MAX6843/MAX6844/MAX6845 assert a reset when the voltage at RESET IN falls below the RESET IN threshold (V_{RSTIN}). The low-leakage current at RESET IN allows for relatively large-value resistors to be used, which reduces power consumption. For example, for $V_{\text{CC-TH}} = 0.9\text{V}$, if $R_2 = 100\text{k}\Omega$, then $R_1 = 26.3\text{k}\Omega$.

Applications Information

VCC Falling Transients

The MAX6841-MAX6845 are relatively immune to short-duration falling V_{CC} transients (glitches). Figure 2 shows typical transient duration vs. reset comparator overdrive, for which the MAX6841-MAX6845 do not generate a reset pulse. The graph was generated using a falling pulse applied to V_{CC} , starting 0.1V above the actual reset threshold and ending below it by the magnitude indicated (reset comparator overdrive). The graph indicates the maximum pulse width that a falling V_{CC} transient can have without causing a reset pulse. As the magnitude of the transient increases (goes further below the reset threshold), the maximum allowable pulse width decreases. A 0.1 μF bypass capacitor mounted as close as possible to the V_{CC} pin provides additional transient immunity.

Ensuring a Valid Reset Output Down to $V_{\text{CC}} = 0$

When V_{CC} falls below 0.55V, the MAX6841/MAX6843 push-pull RESET output no longer sinks current; it becomes an open circuit. Therefore, high-impedance CMOS-logic inputs connected to RESET can drift to undetermined voltages. This presents no problem in

Figure 2. Maximum Transient Duration vs. Overdrive

most applications, because most μP and other circuitry are inoperative with V_{CC} lower than 0.55V. However, in applications in which RESET must be valid down to 0, adding a pullup resistor to RESET causes any stray leakage currents to flow to ground, holding RESET low (Figure 3). R_3 's value is not critical; 200k Ω is large enough not to load RESET and small enough to pull RESET to ground.

Figure 3. RESET Valid to $V_{\text{CC}} = 0$

A 200k Ω pullup resistor to V_{CC} is also recommended for the MAX6841/MAX6842/MAX6844 if push-pull RESET is required to remain valid for $V_{\text{CC}} \leq 0.75\text{V}$.

Interfacing to μPs with Bidirectional Reset Pins

Because the RESET output on the MAX6842/MAX6845 is open drain, these devices interface easily with μPs that have bidirectional reset pins. Connecting the μP supervisor's RESET output directly to the μP 's RESET pin with a single pullup resistor allows either device to assert reset (Figure 4).

Figure 4. Interfacing to Microprocessors with Bidirectional Reset I/O

Ultra-Low-Voltage μ P Reset Circuits and Voltage Detectors

Figure 5. Using the MAX6842/MAX6845 Open-Drain RESET Output with Multiple Supplies

Using the MAX6842/MAX6845 Open-Drain RESET Output with Multiple Supplies

Generally, the pullup connected to the MAX6842/MAX6845 connects to the supply voltage being monitored at the IC's VCC pin. However, some systems use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 5). Note that as the MAX6842/MAX6845's VCC decreases, so does the IC's ability to sink current at RESET. Also, with any pullup, RESET is pulled high as VCC decays toward 0. The voltage where this occurs depends on the pullup resistor value and the voltage to which it is connected.
