## Complete, 12-Bit Voltage-Output DACs

MX7245/MX7248

### General Description

The MX7245/MX7248 are complete, 12-bit digital-to-analog converters (DACs) that include an internal voltage reference and a voltage-output amplifier. The MX7245/MX7248 are pin and electrically compatible with Analog Devices' AD7245/AD7248.

The MX7245/MX7248 have double-buffered logic interfaces that are easily interfaced to microprocessors ( $\mu$ Ps). Data is transferred into the Input register from a 12-bit-wide data bus (MX7245) for 16-bit  $\mu$ Ps, or in a right-justified (8+4)-bit format (MX7248) for 8- and 16-bit  $\mu$ Ps. All logic signals are level triggered and are TTL and CMOS compatible. The timing specifications ensure compatibility with common  $\mu$ Ps.

The DACs are specified and tested for both dual- and single-supply operation. Usable supplies range from single +12V to dual  $\pm 15$ V.

Internal gain-setting resistors allow three output voltage ranges: 0V to +5V and 0V to +10V can be generated using either single or dual supplies. With dual supplies, an additional output range of  $\pm 5$ V is available. The output amplifier drives 2k $\Omega$  loads to +10V.

See MAX507/MAX508 data sheet for detailed description.

**Note 1:** The output can be shorted to either supply rail if the package power dissipation is not exceeded. Typical short-circuit current to AGND is 25mA.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
