

**THE DATASHEET OF
RM57L843BZWTT**

RM57L843 Hercules™ Microcontroller Based on the ARM® Cortex®-R Core

1 Device Overview

1.1 Features

- High-Performance Microcontroller for Safety-Critical Applications
 - Dual-Core Lockstep CPUs With ECC-Protected Caches
 - ECC on Flash and RAM Interfaces
 - Built-In Self-Test (BIST) for CPU, High-End Timers, and On-Chip RAMs
 - Error Signaling Module (ESM) With Error Pin
 - Voltage and Clock Monitoring
- ARM® Cortex® - R5F 32-Bit RISC CPU
 - 1.66 DMIPS/MHz With 8-Stage Pipeline
 - FPU With Single- and Double-Precision
 - 16-Region Memory Protection Unit (MPU)
 - 32KB of Instruction and 32KB of Data Caches With ECC
 - Open Architecture With Third-Party Support
- Operating Conditions
 - Up to 330-MHz CPU Clock
 - Core Supply Voltage (VCC): 1.14 to 1.32 V
 - I/O Supply Voltage (VCCIO): 3.0 to 3.6 V
- Integrated Memory
 - 4MB of Program Flash With ECC
 - 512KB of RAM With ECC
 - 128KB of Data Flash for Emulated EEPROM With ECC
- 16-Bit External Memory Interface (EMIF)
- Hercules™ Common Platform Architecture
 - Consistent Memory Map Across Family
 - Real-Time Interrupt (RTI) Timer (OS Timer)
 - Two 128-Channel Vectored Interrupt Modules (VIMs) With ECC Protection on Vector Table
 - VIM1 and VIM2 in Safety Lockstep Mode
 - Two 2-Channel Cyclic Redundancy Checker (CRC) Modules
- Direct Memory Access (DMA) Controller
 - 32 Channels and 48 Peripheral Requests
 - ECC Protection for Control Packet RAM
 - DMA Accesses Protected by Dedicated MPU
- Frequency-Modulated Phase-Locked Loop (FMPLL) With Built-In Slip Detector
- Separate Nonmodulating PLL
- IEEE 1149.1 JTAG, Boundary Scan, and ARM CoreSight™ Components
- Advanced JTAG Security Module (AJSM)
- Trace and Calibration Capabilities
 - ETM™, RTP, DMM, POM
- Multiple Communication Interfaces
 - 10/100 Mbps Ethernet MAC (EMAC)
 - IEEE 802.3 Compliant (3.3-V I/O Only)
 - Supports MII, RMII, and MDIO
 - Four CAN Controller (DCAN) Modules
 - 64 Mailboxes, Each With ECC Protection
 - Compliant to CAN Protocol Version 2.0B
 - Two Inter-Integrated Circuit (I²C) Modules
 - Five Multibuffered Serial Peripheral Interface (MibSPI) Modules
 - MibSPI1: 256 Words With ECC Protection
 - Other MibSPIs: 128 Words With ECC Protection
 - Four UART (SCI) Interfaces, Two With Local Interconnect Network (LIN 2.1) Interface Support
- Two Next Generation High-End Timer (N2HET) Modules
 - 32 Programmable Channels Each
 - 256-Word Instruction RAM With Parity
 - Hardware Angle Generator for Each N2HET
 - Dedicated High-End Timer Transfer Unit (HTU) for Each N2HET
- Two 12-Bit Multibuffered Analog-to-Digital Converter (MibADC) Modules
 - MibADC1: 32 Channels Plus Control for up to 1024 Off-Chip Channels
 - MibADC2: 25 Channels
 - 16 Shared Channels
 - 64 Result Buffers Each With Parity Protection
- Enhanced Timing Peripherals
 - 7 Enhanced Pulse Width Modulator (ePWM) Modules
 - 6 Enhanced Capture (eCAP) Modules
 - 2 Enhanced Quadrature Encoder Pulse (eQEP) Modules
- Three On-Die Temperature Sensors
- Up to 145 Pins Available for General-Purpose I/O (GPIO)
- 16 Dedicated GPIO Pins With External Interrupt Capability
- Packages
 - 337-Ball Grid Array (ZWT) [Green]

1.2 Applications

- Industrial Safety Applications
 - Industrial Automation
 - Industrial Motor Drives
 - Safe Programmable Logic Controllers (PLCs)
 - Power Generation and Distribution
 - Turbines and Windmills
 - Elevators and Escalators

1.3 Description

The RM57L843 device is part of the [Hercules](#) RM series of high-performance ARM® Cortex®-R-based MCUs. Comprehensive documentation, tools, and software are available to assist in the development of IEC 61508 functional safety applications. Start evaluating today with the [Hercules RM57x LaunchPad Development Kit](#). The RM57L843 device has on-chip diagnostic features including: dual CPUs in lockstep, Built-In Self-Test (BIST) logic for CPU, the N2HET coprocessors, and for on-chip SRAMs; ECC protection on the L1 caches, L2 flash, and SRAM memories. The device also supports ECC or parity protection on peripheral memories and loopback capability on peripheral I/Os.

The RM57L843 device integrates two ARM Cortex-R5F floating-point CPUs, operating in lockstep, which offer an efficient 1.66 DMIPS/MHz, and can run up to 330 MHz providing up to 547 DMIPS. The device supports the little-endian [LE] format.

The RM57L843 device has 4MB of integrated flash and 512KB of data RAM with single-bit error correction and double-bit error detection. The flash memory on this device is a nonvolatile, electrically erasable and programmable memory, implemented with a 64-bit-wide data bus interface. The flash operates on a 3.3-V supply input (the same level as the I/O supply) for all read, program, and erase operations. The SRAM supports read and write accesses in byte, halfword, and word modes.

The RM57L843 device features peripherals for real-time control-based applications, including two Next Generation High-End Timer (N2HET) timing coprocessors with up to 64 total I/O terminals.

The N2HET is an advanced intelligent timer that provides sophisticated timing functions for real-time applications. The timer is software-controlled, with a specialized timer micromachine and an attached I/O port. The N2HET can be used for pulse-width-modulated outputs, capture or compare inputs, or GPIO. The N2HET is especially well suited for applications requiring multiple sensor information or drive actuators with complex and accurate time pulses. The High-End Timer Transfer Unit (HTU) can perform DMA-type transactions to transfer N2HET data to or from main memory. A Memory Protection Unit (MPU) is built into the HTU.

The Enhanced Pulse Width Modulator (ePWM) module can generate complex pulse width waveforms with minimal CPU overhead or intervention. The ePWM is easy to use and supports both high-side and low-side PWM and deadband generation. With integrated trip zone protection and synchronization with the on-chip MibADC, the ePWM is ideal for digital motor control applications.

The Enhanced Capture (eCAP) module is essential in systems where the accurately timed capture of external events is important. The eCAP can also be used to monitor the ePWM outputs or for simple PWM generation when not needed for capture applications.

The Enhanced Quadrature Encoder Pulse (eQEP) module directly interfaces with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine as used in high-performance motion and position-control systems.

The device has two 12-bit-resolution MibADCs with 41 total channels and 64 words of parity-protected buffer RAM. The MibADC channels can be converted individually or by group for special conversion sequences. Sixteen channels are shared between the two MibADCs. Each MibADC supports three separate groupings. Each sequence can be converted once when triggered or configured for continuous conversion mode. The MibADC has a 10-bit mode for use when compatibility with older devices or faster conversion time is desired. One of the channels in MibADC1 and two of the channels in MibADC2 can be used to convert temperature measurements from the three on-chip temperature sensors.

The device has multiple communication interfaces: Five MibSPIs; four UART (SCI) interfaces, two with LIN support; four CANs; two I2C modules; and one Ethernet controller. The SPI provides a convenient method of serial interaction for high-speed communications between similar shift-register type devices. The LIN supports the Local Interconnect standard (LIN 2.1) and can be used as a UART in full-duplex mode using the standard Non-Return-to-Zero (NRZ) format. The DCAN supports the CAN 2.0B protocol standard and uses a serial, multimaster communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 Mbps. The DCAN is ideal for applications operating in noisy and

harsh environments (for example, automotive and industrial fields) that require reliable serial communication or multiplexed wiring. The Ethernet module supports MII, RMI, and Management Data I/O (MDIO) interfaces. The I2C module is a multimaster communication module providing an interface between the microcontroller and an I²C-compatible device through the I²C serial bus. The I2C module supports speeds of 100 and 400 kbps.

The Frequency-Modulated Phase-Locked Loop (FMPLL) clock module multiplies the external frequency reference to a higher frequency for internal use. The Global Clock Module (GCM) manages the mapping between the available clock sources and the internal device clock domains.

The device also has two External Clock Prescaler (ECP) modules. When enabled, the ECPs output a continuous external clock on the ECLK1 and ECLK2 balls. The ECLK frequency is a user-programmable ratio of the peripheral interface clock (VCLK) frequency. This low-frequency output can be monitored externally as an indicator of the device operating frequency.

The Direct Memory Access (DMA) controller has 32 channels, 48 peripheral requests, and ECC protection on its memory. An MPU is built into the DMA to protect memory against erroneous transfers.

The Error Signaling Module (ESM) monitors on-chip device errors and determines whether an interrupt or external Error pin/ball (nERROR) is triggered when a fault is detected. The nERROR signal can be monitored externally as an indicator of a fault condition in the microcontroller.

The External Memory Interface (EMIF) provides a memory extension to asynchronous and synchronous memories or other slave devices.

A Parameter Overlay Module (POM) is included to enhance the debugging capabilities of application code. The POM can reroute flash accesses to internal RAM or to the EMIF, thus avoiding the reprogramming steps necessary for parameter updates in flash. This capability is particularly helpful during real-time system calibration cycles.

Several interfaces are implemented to enhance the debugging capabilities of application code. In addition to the built-in ARM Cortex-R5F CoreSight debug features, the Embedded Cross Trigger (ECT) supports the interaction and synchronization of multiple triggering events within the SoC. An External Trace Macrocell (ETM) provides instruction and data trace of program execution. For instrumentation purposes, a RAM Trace Port (RTP) module is implemented to support high-speed tracing of RAM and peripheral accesses by the CPU or any other master. A Data Modification Module (DMM) gives the ability to write external data into the device memory. Both the RTP and DMM have no or minimal impact on the program execution time of the application code.

With integrated safety features and a wide choice of communication and control peripherals, the RM57L843 device is an ideal solution for high-performance real-time control applications with safety-critical requirements.

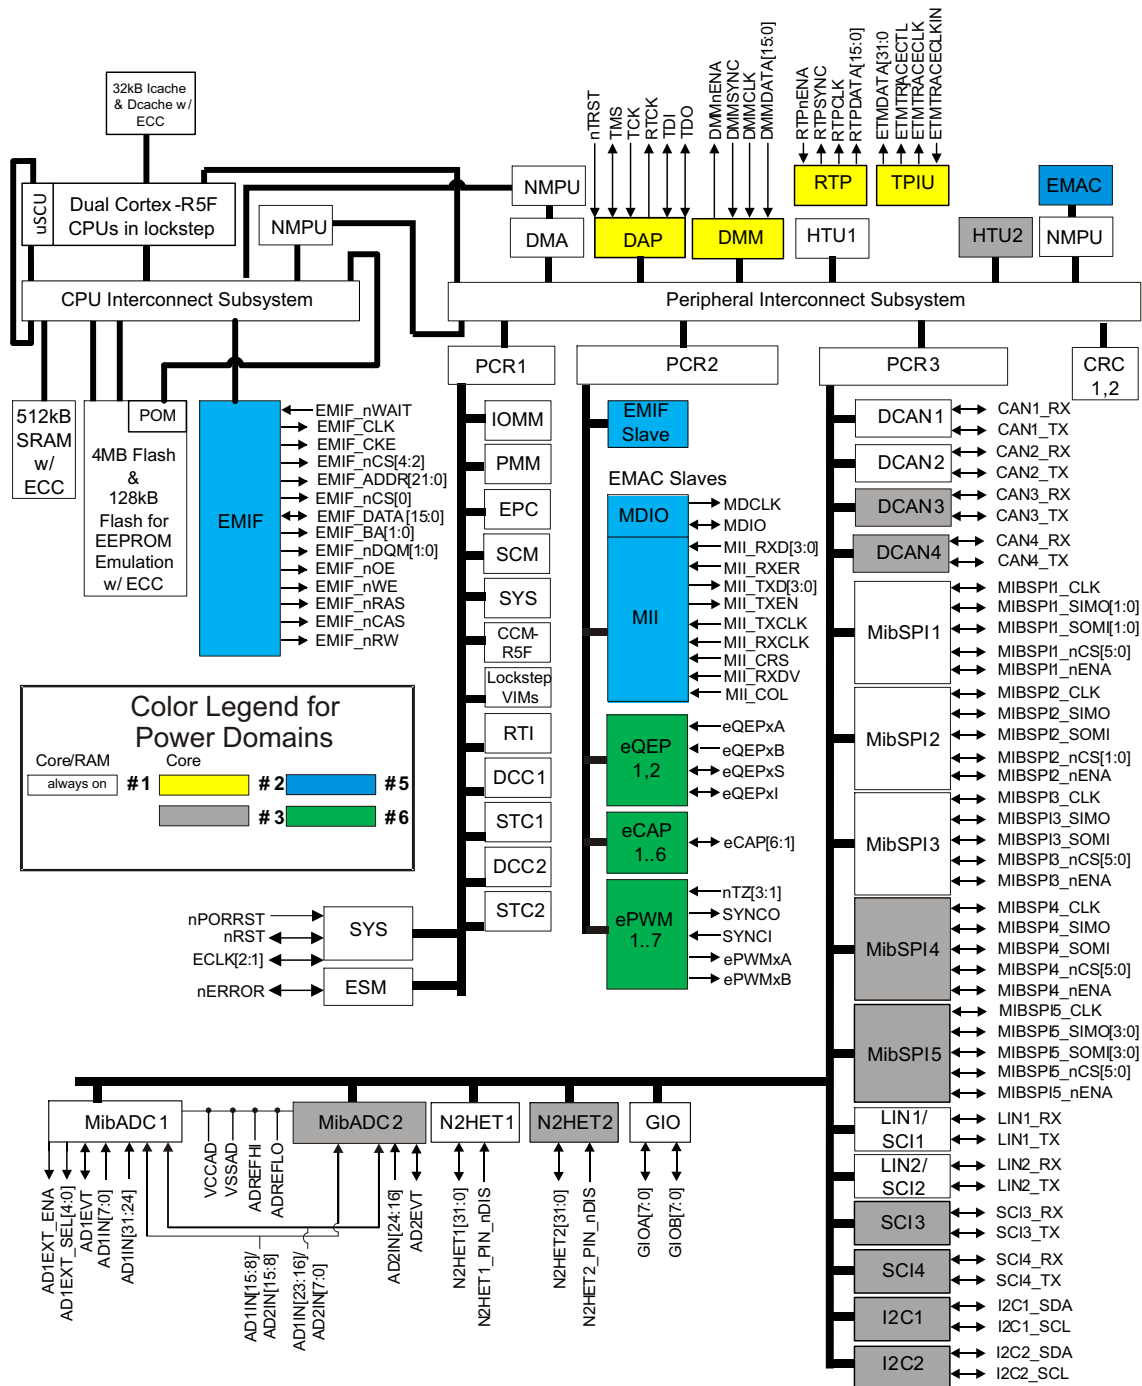

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE |
|-------------|-------------|---------------------|
| RM57L843ZWT | NFBGA (337) | 16.00 mm x 16.00 mm |

2 Revision History

This data manual revision history highlights the technical changes made to the SPNS215B device-specific data manual to make it an SPNS215C revision. These devices are now in the Production Data (PD) stage of development.

| Changes from January 31, 2016 to June 25, 2016 (from B Revision (January 2016) to C Revision) | Page |
|--|---------------------|
| • Global: Updated/Changed the product status from Product Preview to Production Data..... | 1 |
| • Section 1.2 (Applications): Updated/Changed section..... | 2 |
| • Table 6-13 (LPO Specifications): Updated/Changed LPO - HF oscillator, Untrimmed frequency TYP value from "9.6" to "9" MHz..... | 77 |
| • Section 6.9.3 (Special Consideration for CPU Access Errors Resulting in Imprecise Aborts): Add missing subsection..... | 95 |
| • Added 300MHz limit to PBIST testing of ATB RAM..... | 104 |
| • Section 6.14.1 (External Memory Interface (EMIF), Features): Updated/Changed the EMIF asynchronous memory maximum addressable size from "32KB" to "16MB" each..... | 108 |
| • Section 6.14 (External Memory Interface (EMIF)): Added 32-bit access note using a 16-bit EMIF interface..... | 108 |
| • Added "Commonly caused by ..." statement for clarification..... | 129 |
| • Table 6-56 (ETMTRACECLK Timing): Restructured timing table formatting to standards..... | 147 |
| • Table 7-7 , (eCAPx Clock Enable Control): Updated/Changed "ePWM" to "eCAP" in the MODULE INSTANCE column..... | 160 |
| • Table 7-11 , (eQEPx Clock Enable Control): Updated/Changed "ePWM" to "eQEP" in the MODULE INSTANCE column..... | 162 |
| • Table 7-16 (MibADC1 Event Trigger Selection): Added lead-in paragraph referencing the able..... | 164 |
| • (MibADC1 Event Trigger Hookup): NOTE: Added new paragraph..... | 166 |
| • Table 7-17 (MibADC2 Event Trigger Selection): Added lead-in paragraph referencing the able..... | 166 |
| • Section 7.4.2.3 (Controlling ADC1 and ADC2 Event Trigger Options Using SOC Output from ePWM Modules): Updated/Changed the names of the four ePWM signals that event trigger the ADC..... | 168 |
| • Table 7-22 (MibADC Operating Characteristics Over 3.0 V to 3.6 V Operating Conditions): Updated/Changed the 10- and 12-bit mode formulas to be superscript power of 2 values..... | 173 |
| • Table 7-23 (MibADC Operating Characteristics Over 3.6 V to 5.25 V Operating Conditions): Updated/Changed the 10- and 12-bit mode formulas to be superscript power of 2 values..... | 173 |
| • Figure 9-1 (RM57L843 Device Numbering Conventions): Updated/Changed image..... | 209 |

3 Device Comparison

Figure 4-1. ZWT Package Pinout. Top View

Note: Balls can have multiplexed functions. See Section 4.2.2 for detailed information.

4.2 Terminal Functions

Table 4-1 through Table 4-26 identify the external signal names, the associated terminal numbers along with the mechanical package designator, the terminal type (Input, Output, I/O, Power, or Ground), whether the terminal has any internal pullup/pulldown, whether the terminal can be configured as a GIO, and a functional terminal description. The first signal name listed is the primary function for that terminal. The signal name in **Bold** is the function being described. For information on how to select between different multiplexed functions, see the Section 4.2.2, *Multiplexing* of this data manual along with the I/O Multiplexing Module (IOMM) chapter in the Technical Reference Manual (TRM) ([SPNU562](#)).

NOTE

In the Terminal Functions tables below, the "Default Pull State" is the state of the pull applied to the terminal while nPORRST is low and immediately after nPORRST goes High. The default pull direction may change when software configures the pin for an alternate function. The "Pull Type" is the type of pull asserted when the signal name in bold is enabled for the given terminal by the IOMM control registers.

All I/O signals except nRST are configured as inputs while nPORRST is low and immediately after nPORRST goes High. While nPORRST is low, the input buffers are disabled, and the output buffers are disabled with the default pulls enabled.

All output-only signals have the output buffer disabled and the default pull enabled while nPORRST is low, and are configured as outputs with the pulls disabled immediately after nPORRST goes High.

4.2.1 ZWT Package

4.2.1.1 Multibuffered Analog-to-Digital Converters (MibADC)

Table 4-1. ZWT Multibuffered Analog-to-Digital Converters (MibADC1, MibADC2)

| TERMINAL | | SIGNAL TYPE | DEFAULT PULL STATE | PULL TYPE | OUTPUT BUFFER DRIVE STRENGTH | DESCRIPTION |
|------------------------------------|---------|-------------|--------------------|--------------------------|------------------------------|----------------------------------|
| SIGNAL NAME | 337 ZWT | | | | | |
| AD1EVT/MII_RX_ER/RMII_RX_ER/nTZ1_1 | N19 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | ADC1 event trigger input, or GIO |
| AD1IN[0] | W14 | Input | - | - | - | ADC1 Input |
| AD1IN[1] | V17 | Input | - | - | - | ADC1 Input |
| AD1IN[2] | V18 | Input | - | - | - | ADC1 Input |
| AD1IN[3] | T17 | Input | - | - | - | ADC1 Input |
| AD1IN[4] | U18 | Input | - | - | - | ADC1 Input |
| AD1IN[5] | R17 | Input | - | - | - | ADC1 Input |
| AD1IN[6] | T19 | Input | - | - | - | ADC1 Input |
| AD1IN[7] | V14 | Input | - | - | - | ADC1 Input |
| AD1IN[8]/AD2IN[8] | P18 | Input | - | - | - | ADC1/ADC2 shared Input |
| AD1IN[9]/AD2IN[9] | W17 | Input | - | - | - | ADC1/ADC2 shared Input |
| AD1IN[10]/AD2IN[10] | U17 | Input | - | - | - | ADC1/ADC2 shared Input |
| AD1IN[11]/AD2IN[11] | U19 | Input | - | - | - | ADC1/ADC2 shared Input |

Table 4-1. ZWT Multibuffered Analog-to-Digital Converters (MibADC1, MibADC2) (continued)

| TERMINAL | | SIGNAL TYPE | DEFAULT PULL STATE | PULL TYPE | OUTPUT BUFFER DRIVE STRENGTH | DESCRIPTION |
|-------------|---------|-------------|--------------------|-----------|------------------------------|--------------------------|
| SIGNAL NAME | 337 ZWT | | | | | |
| VCCAD | W15(3) | Input | - | - | - | Operating supply for ADC |
| VSSAD | W16(3) | Input | - | - | - | ADC supply ground |
| VSSAD | W19(3) | Input | - | - | - | ADC supply ground |

- (1) This ADC channel is also multiplexed with an internal temperature sensor.
- (2) This is the secondary terminal at which the signal is also available. See [Section 4.2.2.2](#) for more detail on how to select between the available terminals for input functionality.
- (3) The ADREFHI, ADREFLO, VCCAD, and VSSAD connections are common for both ADC cores.

4.2.1.2 Enhanced High-End Timer Modules (N2HET)

Table 4-2. ZWT Enhanced High-End Timer Modules (N2HET)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|--|---------|-------------|--------------------|--------------------------|------------------------------|---|
| Signal Name | 337 ZWT | | | | | |
| N2HET1[0]/MIBSPI4CLK/ePWM2B | K18 | I/O | Pulldown | Programmable, 20 μ A | 2 mA ZD | N2HET1 time input capture or output compare, or GIO |
| N2HET1[1]/MIBSPI4NENA/N2HET2[8]/eQEP2A | V2 | I/O | Pulldown | Programmable, 20 μ A | 2 mA ZD | N2HET1 time input capture or output compare, or GIO |
| N2HET1[2]/MIBSPI4SIMO/ePWM3A | W5 | I/O | Pulldown | Programmable, 20 μ A | 2 mA ZD | N2HET1 time input capture or output compare, or GIO |
| N2HET1[3]/MIBSPI4NCS[0]/N2HET2[10]/eQEP2B | U1 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | N2HET1 time input capture or output compare, or GIO |
| N2HET1[4]/MIBSPI4NCS[1]/ePWM4B | B12 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | N2HET1 time input capture or output compare, or GIO |
| N2HET1[5]/MIBSPI4SOMI/N2HET2[12]/ePWM3B | V6 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | N2HET1 time input capture or output compare, or GIO |
| N2HET1[6]/SCI3RX/ePWM5A | W3 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | N2HET1 time input capture or output compare, or GIO |

| EMIF_ADDR[20]/RTP_nSYNC | C16 | I/O | Pullup | Programmable, 20 μ A | 8mA | RTP synchronization, or GIO |

(1) This is the secondary terminal at which the signal is also available. See [Section 4.2.2.2](#) for more detail on how to select between the available terminals for input functionality.

4.2.1.4 Enhanced Capture Modules (eCAP)
Table 4-4. ZWT Enhanced Capture Modules (eCAP)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|---|---------|-------------|--------------------|-------------------|------------------------------|-------------------------------|
| Signal Name | 337 ZWT | | | | | |
| N2HET1[15]/MIBSPI1NCS[4]/N2HET2[22]/ ECAP1 | N1 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced Capture Module 1 I/O |
| MIBSPI3SOMI/AD1EXT_ENA/ ECAP2 | V8 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced Capture Module 2 I/O |
| MIBSPI3SIMO/AD1EXT_SEL[0]/ ECAP3 | W8 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced Capture Module 3 I/O |
| MIBSPI1NENA/MII_RXD[2]/N2HET1[23]/ ECAP4 | G19 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced Capture Module 4 I/O |
| MIBSPI5NENA/DMM_DATA[7]/MII_RXD[3]/ ECAP5 | H18 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced Capture Module 5 I/O |
| MIBSPI1NCS[0]/MIBSPI1SOMI[1]/MII_TXD[2]/ ECAP6 | R2 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced Capture Module 6 I/O |

4.2.1.5 Enhanced Quadrature Encoder Pulse Modules (eQEP)

Table 4-5. ZWT Enhanced Quadrature Encoder Pulse Modules (eQEP)(1)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|---|---------|-------------|--------------------|-------------------|------------------------------|-----------------------|
| Signal Name | 337 ZWT | | | | | |
| MIBSPI3CLK/AD1EXT_SEL[1]/ eQEP1A | V9 | Input | Pullup | Fixed, 20 μ A | - | Enhanced QEP1 Input A |
| MIBSPI3NENA/MIBSPI3NCS[5]/N2HET1[31]/ eQEP1B | W9 | Input | Pullup | Fixed, 20 μ A | - | Enhanced QEP1 Input B |
| MIBSPI3NCS[0]/AD2EVT/ eQEP1I | V10 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced QEP1 Index |
| MIBSPI1NCS[1]/MII_COL/N2HET1[17]/ eQEP1S | F3 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced QEP1 Strobe |
| N2HET1[1]/MIBSPI4NENA/N2HET2[8]/ eQEP2A | V2 | Input | Pullup | Fixed, 20 μ A | - | Enhanced QEP2 Input A |
| N2HET1[3]/MIBSPI4NCS[0]/N2HET2[10]/ eQEP2B | U1 | Input | Pullup | Fixed, 20 μ A | - | Enhanced QEP2 Input B |
| GIOA[2]/N2HET2[0]/ eQEP2I | C1 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced QEP2 Index |
| N2HET1[30]/MII_RX_DV/ eQEP2S | B11 | I/O | Pullup | Fixed, 20 μ A | 8mA | Enhanced QEP2 Strobe |

(1) These signals are double-synchronized and then optionally filtered with a 6-cycle VCLK4-based counter.

4.2.1.6 Enhanced Pulse-Width Modulator Modules (ePWM)

Table 4-6. ZWT Enhanced Pulse-Width Modulator Modules (ePWM)

| TERMINAL | | SIGNAL TYPE | DEFAULT PULL STATE | PULL TYPE | OUTPUT BUFFER DRIVE STRENGTH | DESCRIPTION |
|--|--------------------|-------------|--------------------|--------------|------------------------------|---------------------------------|
| SIGNAL NAME | 337 ZWT | | | | | |
| ePWM1A | D9 | Output | – | – | 8 mA | Enhanced PWM1 Output A |
| GIOA[5]/EXTCLKIN1/ePWM1A | B5 ⁽¹⁾ | | | | | |
| ePWM1B | D10 | Output | – | – | 8 mA | Enhanced PWM1 Output B |
| GIOA[6]/N2HET2[4]/ePWM1B | H3 ⁽¹⁾ | | | | | |
| N2HET1[16]/ePWM1SYNCl/ePWM1SYNCO | A4 | Input | Pulldown | Fixed, 20 µA | – | External ePWM Sync Pulse Input |
| N2HET1[11]/MIBSPI3NCS[4]/N2HET2[18]/ePWM1SYNCO | E3 | Output | Pulldown | 20 µA | 2mA ZD | External ePWM Sync Pulse Output |
| N2HET1[16]/ePWM1SYNCl/ePWM1SYNCO | A4 ⁽¹⁾ | | | | | |
| GIOA[7]/N2HET2[6]/ePWM2A | M1 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM2 Output A |
| N2HET1[0]/MIBSPI4CLK/ePWM2B | K18 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM2 Output B |
| N2HET1[2]/MIBSPI4SIMO/ePWM3A | W5 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM3 Output A |
| N2HET1[5]/MIBSPI4SOMI/N2HET2[12]/ePWM3B | V6 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM3 Output B |
| MIBSPI5NCS[0]/DMM_DATA[5]/ePWM4A | E19 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM4 Output A |
| N2HET1[4]/MIBSPI4NCS[1]/ePWM4B | B12 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM4 Output B |
| N2HET1[6]/SCI3RX/ePWM5A | W3 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM5 Output A |
| N2HET1[13]/SCI3TX/N2HET2[20]/ePWM5B | N2 | Output | Pulldown | 20 µA | 8 mA | Enhanced PWM5 Output B |
| N2HET1[18]/EMIF_RNW/ePWM6A | J1 | Output | – | – | 8 mA | Enhanced PWM6 Output A |
| N2HET1[20]/EMIF_nDQM[1]/ePWM6B | P2 | Output | – | – | 8 mA | Enhanced PWM6 Output B |
| N2HET1[9]/MIBSPI4NCS[3]/N2HET2[16]/ePWM7A | V7 | Output | – | – | 8 mA | Enhanced PWM7 Output A |
| N2HET1[7]/MIBSPI4NCS[2]/N2HET2[14]/ePWM7B | T1 | Output | – | – | 8 mA | Enhanced PWM7 Output B |
| AD1EVT/MII_RX_ER/RMII_RX_ER/nTZ1_1 | N19 | Input | Pulldown | Fixed, 20 µA | – | Trip Zone 1 Input 1 |
| MIBSPI3NCS[3]/I2C1_SCL/N2HET1[29]/nTZ1_1 | C3 ⁽¹⁾ | | | | | |
| GIOB[7]/nTZ1_2 | F1 | Input | Pulldown | Fixed, 20 µA | – | Trip Zone 1 Input 2 |
| MIBSPI3NCS[2]/I2C1_SDA/N2HET1[27]/nTZ1_2 | B2 ⁽¹⁾ | | | | | |
| MIBSPI1NCS[3]/N2HET1[21]/nTZ1_3 | J3 | Input | Pullup | Fixed, 20 µA | – | Trip Zone 1 Input 3 |
| N2HET1[10]/MIBSPI4NCS[4]/MII_TX_CLK/nTZ1_3 | D19 ⁽¹⁾ | | | | | |

(1) This is the secondary terminal at which the signal is also available. See [Section 4.2.2.2](#) for more detail on how to select between the available terminals for input functionality.

4.2.1.7 Data Modification Module (DMM)

Table 4-7. ZWT Data Modification Module (DMM)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|---|---------|-------------|--------------------|--------------------------|------------------------------|-----------------------------|
| Signal Name | 337 ZWT | | | | | |
| DMM_CLK | F17 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | DMM clock, or GIO |
| DMM_DATA[0] | L19 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | DMM data, or GIO |
| DMM_DATA[1] | L18 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | DMM data, or GIO |
| MIBSPI5NCS[2]/ DMM_DATA[2] | W6 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | DMM data, or GIO |

| EMIF_nCS[4]/RTP_DATA[7]/ GIOB[5] | M17(1) | | | | | |

Table 4-8. ZWT General-Purpose Input / Output (GIO) (continued)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|--------------------|---------|-------------|--------------------|---------------------|------------------------------|---|
| Signal Name | 337 ZWT | | | | | |
| GIOB[6]/nERROR | J2 | I/O | Pulldown | Programmable, 20 µA | 2mA ZD | General-purpose I/O, external interrupt capable |
| EMIF_nRAS/GIOB[6] | R3(1) | | | | | |
| GIOB[7]/nTZ1_2 | F1 | I/O | Pulldown | Programmable, 20 µA | 2mA ZD | General-purpose I/O, external interrupt capable |
| EMIF_nWAIT/GIOB[7] | P3(1) | | | | | |

(1) This is the secondary terminal at which the signal is also available. See [Section 4.2.2.2](#) for more detail on how to select between the available terminals for input functionality.

4.2.1.9 Controller Area Network Controllers (DCAN)

Table 4-9. ZWT Controller Area Network Controllers (DCAN)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|-----------------|---------|-------------|--------------------|--------------------------|------------------------------|-----------------------|
| Signal Name | 337 ZWT | | | | | |
| DCAN1RX | B10 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | CAN1 receive, or GIO |
| DCAN1TX | A10 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | CAN1 transmit, or GIO |
| DCAN2RX | H1 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | CAN2 receive, or GIO |
| DCAN2TX | H2 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | CAN2 transmit, or GIO |
| DCAN3RX | M19 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | CAN3 receive, or GIO |
| DCAN3TX | M18 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | CAN3 transmit, or GIO |
| GIOB[3]/DCAN4RX | W10 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | CAN4 receive, or GIO |
| GIOB[2]/DCAN4TX | F2 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | CAN4 transmit, or GIO |

4.2.1.10 Local Interconnect Network Interface Module (LIN)

Table 4-10. ZWT Local Interconnect Network Interface Module (LIN)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|-------------------|---------|-------------|--------------------|--------------------------|------------------------------|----------------------|
| Signal Name | 337 ZWT | | | | | |
| LIN1RX | A7 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | LIN receive, or GIO |
| LIN1TX | B7 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | LIN transmit, or GIO |
| N2HET2[19]/LIN2RX | P4 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | LIN receive, or GIO |
| N2HET2[20]/LIN2TX | T5 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | LIN transmit, or GIO |

4.2.1.11 Standard Serial Communication Interface (SCI)

Table 4-11. ZWT Standard Serial Communication Interface (SCI)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|--|---------|-------------|--------------------|--------------------------|------------------------------|----------------------|
| Signal Name | 337 ZWT | | | | | |
| N2HET1[6]/ SCI3RX /ePWM5A | W3 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | SCI receive, or GIO |
| N2HET1[13]/ SCI3TX /N2HET2[20]/ePWM5B | N2 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | SCI transmit, or GIO |
| N2HET1[17]/EMIF_nOE/ SCI4RX | A13 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | SCI receive, or GIO |
| N2HET1[19]/EMIF_nDQM[0]/ SCI4TX | B13 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD | SCI transmit, or GIO |

4.2.1.12 Inter-Integrated Circuit Interface Module (I2C)
Table 4-12. ZWT Inter-Integrated Circuit Interface Module (I2C)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|--|---------|-------------|--------------------|--------------------------|------------------------------|--------------------------|
| Signal Name | 337 ZWT | | | | | |
| MIBSPI3NCS[3]/I2C1_SCL/N2HET1[29]/nTZ1_1 | C3 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | I2C serial clock, or GIO |
| MIBSPI3NCS[2]/I2C1_SDA/N2HET1[27]/nTZ1_2 | B2 | I/O | Pullup | Programmable, 20uA | 2mA ZD | I2C serial data, or GIO |
| MIBSPI5SOMI[3]/DMM_DATA[15]/I2C2_SCL/AD1EXT_ENA | G16 | I/O | Pullup | Programmable, 20uA | 2mA ZD | I2C serial clock, or GIO |
| MIBSPI5SIMO[3]/DMM_DATA[11]/I2C2_SDA/AD1EXT_SEL[2] | G17 | I/O | Pullup | Programmable, 20uA | 2mA ZD | I2C serial data, or GIO |

4.2.1.13 Multibuffered Serial Peripheral Interface Modules (MibSPI)
Table 4-13. ZWT Multibuffered Serial Peripheral Interface Modules (MibSPI)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|---|---------|-------------|--------------------|--------------------------|------------------------------|-------------------------------------|
| Signal Name | 337 ZWT | | | | | |
| MIBSPI1CLK | F18 | I/O | Pullup | Programmable, 20 μ A | 8mA | MibSPI1 clock, or GIO |
| MIBSPI1NCS[0]/MIBSPI1SOMI[1]/MII_TXD[2]/ECAP6 | R2 | I/O | Pullup | Programmable, 20 μ A | 8mA | MibSPI1 chip select, or GIO |
| MIBSPI1NCS[1]/MII_COL/N2HET1[17]/eQEP1S | F3 | I/O | Pullup | Programmable, 20 μ A | 2mA ZD | MibSPI1 chip select, or GIO |

Table 4-17. External Memory Interface (EMIF)(2) (continued)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|----------------------------|---------|-------------|--------------------|-------------------|------------------------------|-------------------------|
| Signal Name | 337 ZWT | | | | | |
| ETMDATA[13]/EMIF_nOE | E12 | Output | Pulldown | 20 μ A | 8mA | EMIF output enable |
| N2HET1[17]/EMIF_nOE/SCI4RX | A13(1) | | | | | |
| EMIF_nRAS/GIOB[6] | R3 | Output | Pulldown | 20 μ A | 8mA | EMIF row address strobe |
| EMIF_nWAIT/GIOB[7] | P3 | Input | Pullup | Fixed, 20 μ A | - | EMIF wait |
| EMIF_nWE/EMIF_RNW | D17 | Output | - | - | 8mA | EMIF write enable |
| EMIF_nWE/EMIF_RNW | D17 | Output | - | - | 8mA | EMIF read-not-write |
| N2HET1[18]/EMIF_RNW/ePWM6A | J1(1) | | | | | |

- (1) This is the secondary terminal at which the signal is also available. See [Section 4.2.2.2](#) for more detail on how to select between the available terminals for input functionality.
- (2) By default, the EMIF interface pins are the primary pins before configuring the IOMM (IO Muxing Module). The output buffers of these pins are forced to tri-state until enabled by setting PINMMR174[8] = 0 and PINMMR174[9] = 1."

4.2.1.16 Embedded Trace Macrocell Interface for Cortex-R5F (ETM-R5)

Table 4-18. ZWT Embedded Trace Macrocell Interface for Cortex-R5F (ETM-R5)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|---|---------|-------------|--------------------|------------|------------------------------|-------------|
| Signal Name | 337 ZWT | | | | | |
| ETMDATA[0] | R12 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[1] | R13 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[2] | J15 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[3] | H15 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[4] | G15 | Output | Pulldown | 20 μ A | 8mA | ETM data |

| ETMDATA[13]/EMIF_nOE | E12 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[14]/EMIF_nDQM[1] | E11 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[15]/EMIF_nDQM[0] | E10 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[16]/EMIF_DATA[0] | K15 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[17]/EMIF_DATA[1] | L15 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[18]/EMIF_DATA[2] | M15 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[19]/EMIF_DATA[3] | N15 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[20]/EMIF_DATA[4] | E5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[21]/EMIF_DATA[5] | F5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[22]/EMIF_DATA[6] | G5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[23]/EMIF_DATA[7] | K5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[24]/EMIF_DATA[8]/N2HET2[24]/MIBSPI5NCS[4] | L5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[25]/EMIF_DATA[9]/N2HET2[25]/MIBSPI5NCS[5] | M5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[26]/EMIF_DATA[10]/N2HET2[26] | N5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[27]/EMIF_DATA[11]/N2HET2[27] | P5 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[28]/EMIF_DATA[12]/N2HET2[28]/GIOA[0] | R5 | Output | Pulldown | 20 μ A | 8mA | ETM data |

Table 4-18. ZWT Embedded Trace Macrocell Interface for Cortex-R5F (ETM-R5) (continued)

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|--|---------|-------------|--------------------|-------------------|------------------------------|------------------------|
| Signal Name | 337 ZWT | | | | | |
| ETMDATA[29] /EMIF_DATA[13]/N2HET2[29]/GIOA[1] | R6 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[30] /EMIF_DATA[14]/N2HET2[30]/GIOA[3] | R7 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMDATA[31] /EMIF_DATA[15]/N2HET2[31]/GIOA[4] | R8 | Output | Pulldown | 20 μ A | 8mA | ETM data |
| ETMTRACECLKIN /EXTCLKIN2/GIOA[5] | R9 | Input | Pullup | Fixed, 20 μ A | - | ETM trace clock input |
| ETMTRACECLKOUT /GIOA[6] | R10 | Output | Pulldown | 20 μ A | 8mA | ETM trace clock output |
| ETMTRACECTL /GIOA[7] | R11 | Output | Pulldown | 20 μ A | 8mA | ETM trace control |

4.2.1.17 System Module Interface

Table 4-19. ZWT System Module Interface

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|----------------|---------|-------------|--------------------|-------------|------------------------------|--|
| Signal Name | 337 ZWT | | | | | |
| nERROR | B14 | Output | Pulldown | 20 μ A | 8mA | ESM error (And of Error 1 and Error 2) |
| GIOB[6]/nERROR | J2 | Output | Pulldown | 20 μ A | 8mA | ESM error 1 |
| nPORRST | W7 | Input | Pulldown | 100 μ A | - | Power-on reset, cold reset |
| nRST | B17 | I/O | Pullup | 100 μ A | 4mA | System reset, warm reset |

4.2.1.18 Clock Inputs and Outputs

Table 4-20. ZWT Clock Inputs and Outputs

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|---------------------------------|---------|-------------|--------------------|--------------------------|------------------------------|--|
| Signal Name | 337 ZWT | | | | | |
| ECLK1 | A12 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD/8mA | External clock output, or GIO |
| EMIF_CLK/ECLK2 | K3 | I/O | Pulldown | Programmable, 20 μ A | 2mA ZD/8mA | External clock output, or GIO |
| GIOA[5]/EXTCLKIN1/ePWM1A | B5 | Input | Pulldown | Fixed, 20 μ A | - | External clock input |
| ETMTRACECLKIN/EXTCLKIN2/GIOA[5] | R9 | Input | Pullup | Fixed, 20 μ A | - | External clock input # 2 |
| KELVIN_GND | L2 | Input | - | - | - | Kelvin ground for oscillator |
| OSCIN | K1 | Input | - | - | - | From external crystal/resonator, or external clock input |
| OSCOU | L1 | Output | - | - | - | To external crystal/resonator |

4.2.1.19 Test and Debug Modules Interface

Table 4-21. ZWT Test and Debug Modules Interface

| TERMINAL | | SIGNAL TYPE | DEFAULT PULL STATE | PULL TYPE | OUTPUT BUFFER DRIVE STRENGTH | DESCRIPTION |
|-------------|---------|-------------|--------------------|--------------------|------------------------------|--|
| SIGNAL NAME | 337 ZWT | | | | | |
| nTRST | D18 | Input | Pulldown | 100 μ A | - | JTAG test hardware reset |
| TCK | B18 | Input | Pulldown | Fixed, 100 μ A | - | JTAG test clock |
| TDI | A17 | Input | Pullup | Fixed, 100 μ A | - | JTAG test data in |
| TDO | C18 | Output | Pulldown | Fixed, 100 μ A | 8mA | JTAG test data out |
| TEST | U2 | Input | Pulldown | Fixed, 100 μ A | - | Test mode enable. This terminal must be connected to ground directly or through a pulldown resistor. |
| TMS | C19 | Input | Pullup | Fixed, 100 μ A | - | JTAG test mode select |
| RTCK | A16 | Output | - | - | 8mA | JTAG return test clock |

4.2.1.20 Flash Supply and Test Pads

Table 4-22. ZWT Flash Supply and Test Pads

| TERMINAL | | SIGNAL TYPE | DEFAULT PULL STATE | PULL TYPE | OUTPUT BUFFER DRIVE STRENGTH | DESCRIPTION |
|-------------|---------|-------------|--------------------|-----------|------------------------------|---|
| SIGNAL NAME | 337 ZWT | | | | | |
| VCCP | F8 | 3.3-V Power | - | - | - | Flash pump supply |
| FLTP1 | J5 | Input | - | - | - | Flash test pads. These terminals are reserved for TI use only. For proper operation these terminals must connect only to a test pad or not be connected at all [no connect (NC)]. |
| FLTP2 | H5 | Input | - | - | - | |

4.2.1.21 Supply for Core Logic: 1.2-V Nominal

Table 4-23. ZWT Supply for Core Logic: 1.2-V Nominal

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|-------------|---------|-------------|--------------------|-----------|------------------------------|-------------|
| Signal Name | 337 ZWT | | | | | |
| VCC | P10 | 1.2-V Power | - | - | - | Core supply |
| VCC | L6 | | - | - | - | Core supply |
| VCC | K6 | | - | - | - | Core supply |
| VCC | F9 | | - | - | - | Core supply |
| VCC | F10 | | - | - | - | Core supply |
| VCC | J14 | | - | - | - | Core supply |
| VCC | K14 | | - | - | - | Core supply |
| VCC | M10 | | - | - | - | Core supply |
| VCC | K8 | | - | - | - | Core supply |
| VCC | H10 | | - | - | - | Core supply |
| VCC | K12 | | - | - | - | Core supply |

4.2.1.22 Supply for I/O Cells: 3.3-V Nominal

Table 4-24. ZWT Supply for I/O Cells: 3.3-V Nominal

| Terminal | | Signal Type | Default Pull State | Pull Type | Output Buffer Drive Strength | Description |
|-------------|---------|-------------|--------------------|-----------|------------------------------|---------------------------|
| Signal Name | 337 ZWT | | | | | |
| VCCIO | F11 | 3.3-V Power | – | – | – | Operating supply for I/Os |
| VCCIO | F12 | | – | – | – | Operating supply for I/Os |
| VCCIO | F13 | | – | – | – | Operating supply for I/Os |
| VCCIO | F14 | | – | – | – | Operating supply for I/Os |

| VSS | J11 | | – | – | – | Ground reference |
| VSS | J12 | | – | – | – | Ground reference |
| VSS | H8 | | – | – | – | Ground reference |
| VSS | H9 | | – | – | – | Ground reference |
| VSS | H11 | | – | – | – | Ground reference |
| VSS | H12 | | – | – | – | Ground reference |

4.2.1.24 Other Supplies
Table 4-26. Other Supplies

| TERMINAL | | 337 ZWT | SIGNAL TYPE | DEFAULT PULL STATE | PULL TYPE | OUTPUT BUFFER DRIVE STRENGTH | DESCRIPTION |
|--------------------------------------|--|------------|----------------|--------------------------|-----------|---------------------------------------|-----------------------|
| SIGNAL NAME | | | | | | | |
| Supply for PLL: 1.2-V nominal | | | | | | | |
| VCCPLL | | P11 | 1.2-V Power | – | – | – | Core supply for PLL's |

4.2.2 Multiplexing

This microcontroller has several interfaces and uses extensive multiplexing to bring out the functions as required by the target application. The multiplexing is mostly on the output signals. A few inputs are also multiplexed to allow the same input signal to be driven in from an alternative terminal. For more information on multiplexing, refer to the IOMM chapter of the device specific technical reference manual.

4.2.2.1 Output Multiplexing

Table 4-27. Output Multiplexing

| Address Offset | 337 ZWT BALL | DEFAULT FUNCTION | Select Bit | Alternate Function 1 | Select Bit | Alternate Function 2 | Select Bit | Alternate Function 3 | Select Bit | Alternate Function 4 | Select Bit | Alternate Function 5 | Select Bit |

4.2.2.1.1 Notes on Output Multiplexing

Table 4-27 lists the output signal multiplexing and control signals for selecting the desired functionality for each pad.

- The pads default to the signal defined by the "Default Function" in Table 4-27.
- The CTRL x columns in Table 4-27 contain a value of type x[y] which indicates the control register PINMMRx, bit y. It indicates the multiplexing control register and the bit that must be set in order to select the corresponding functionality to be output on any particular pad.
 - For example, consider the multiplexing on pin H3 for the 337-ZWT package:

| 337 ZWT BALL | DEFAULT FUNCTION | CTRL1 | OPTION 2 | CTRL2 | OPTION 3 | CTRL3 | OPTION 4 | CTRL4 | OPTION 5 | CTRL5 | OPTION 6 | CTRL6 |
|--------------------|---------------------|--------|----------|-------|-----------|--------|----------|-------|----------|-------|----------|--------|
| H3 | GIOA[6] | 19[24] | | | N2HET2[4] | 19[26] | | | | | ePWM1B | 19[29] |

- When GIOA[6] is configured as an output pin in the GIO module control register, then the programmed output level appears on pin H3 by default. The PINMMR19[24] is set by default to indicate that the GIOA[6] signal is selected to be output.
- If the application must output the N2HET2[4] signal on pin H3, it must clear PINMMR19[24] and set PINMMR19[26].
- Note that the pin is connected as input to both the GIO and N2HET2 modules. That is, there is no input multiplexing on this pin.
- The base address of the IOMM module starts at 0xFFFF_1C00. The Output mux control registers with the first register PINMMR0 starts at the offset address 0x110 within the IOMM module.

4.2.2.2 Input Multiplexing

Some signals are connected to more than one terminals, so that the inputs for these signals can come from either of these terminals. A multiplexor is implemented to let the application choose the terminal that will be used for providing the input signal from among the available options. The input path selection is done based on two bits in the PINMMR control registers as listed in [Table 4-28](#).

Table 4-28. Input Multiplexing

| Address Offset | Signal Name | Default Terminal | Terminal 1 Input Multiplex Control | Alternate Terminal | Terminal 2 Input Multiplex Control |

4.2.2.2.1 Notes on Input Multiplexing

- The Terminal x Input Multiplex Control column in [Table 4-28](#) lists the multiplexing control register and the bit that must be set in order to select the terminal for providing the input signal to the system. For example, N2HET2[22] can appear on two different terminals at terminal number T7 and N1. By default PINMMR98[24] is set and PINMMR98[25] is cleared to select T7 for providing N2HET2[22] to the system. If the application chooses to use N1 for providing N2HET2[22] then PINMMR98[24] must be cleared and PINMMR98[25] must be set.
- Base address of the IOMM module starts at 0xFFFF_1C00. Input mux control registers with the first register PINMMR80 starts at the offset address 0x250 within the IOMM module.

4.2.2.2.2 General Rules for Multiplexing Control Registers

- The PINMMR control registers can only be written in privileged mode. A write in a nonprivileged mode will generate an error response.
- If the application writes all 9's to any PINMMR control register, then the default functions are selected for the affected pads.
- Each byte in a PINMMR control register is used to select the functionality for a given pad. If the application sets more than one bit within a byte for any pad, then the default function is selected for this pad.
- Several bits in the PINMMR control registers are reserved and are not used to enable any functions. If the application sets only these bits and clears the other bits, then the default functions are selected for the affected pads.

5 Specifications

5.1 Absolute Maximum Ratings⁽¹⁾

Over Operating Free-Air Temperature Range

| | | MIN | MAX | UNIT |
|--|--|------|------|------|
| Supply voltage | $V_{CC}^{(2)}$ | -0.3 | 1.43 | V |
| | $V_{CCIO}, V_{CCP}^{(2)}$ | -0.3 | 4.6 | |
| | V_{CCAD} | -0.3 | 6.25 | |
| Input voltage | All input pins, with exception of ADC pins | -0.3 | 4.6 | V |
| | ADC input pins | -0.3 | 6.25 | |
| Input clamp current: | I_{IK} ($V_I < 0$ or $V_I > V_{CCIO}$) All pins, except AD1IN[31:0] and | -20 | 20 | mA |
| | I_{IK} ($V_I < 0$ or $V_I > V_{CCAD}$) AD1IN[31:0] and | -10 | 10 | |
| | Total | -40 | 40 | |
| Operating free-air temperature (T_A) | | -40 | 105 | °C |
| Operating junction temperature (T_J) | | -40 | 130 | °C |
| Storage temperature (T_{stg}) | | -65 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to their associated grounds.

5.2 ESD Ratings

| | | | MIN | MAX | UNIT | |
|-----------|--|----------------------------|------------------------------|------|------|---|
| V_{ESD} | Electrostatic discharge (ESD) performance: | Human Body Model (HBM) | -2 | 2 | kV | |
| | | Charged Device Model (CDM) | All pins except corner balls | -500 | 500 | V |
| | | | Corner balls | -750 | 750 | V |

5.3 Power-On Hours (POH)

POH is a function of voltage and temperature. Usage at higher voltages and temperatures will result in a reduction in POH to achieve the same reliability performance. The POH information in [Table 5-1](#) is provided solely for convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI Semiconductor Products. To avoid significant device degradation, the device POH must be limited to those listed in [Table 5-1](#). To convert to equivalent POH for a specific temperature profile, see the [Calculating Equivalent Power-on-Hours for Hercules Safety MCUs Application Report \(SPNA207\)](#).

Table 5-1. Power-On Hours Limits

| NOMINAL V_{CC} VOLTAGE (V) | JUNCTION TEMPERATURE (T_J) | LIFETIME POH ⁽¹⁾ |
|------------------------------|--------------------------------|-----------------------------|
| 1.2 V | 105 °C | 100K |

- (1) POH represent device operation under the specified nominal conditions continuously for the duration of the calculated lifetime.

5.4 Device Recommended Operating Conditions⁽¹⁾

| | | MIN | NOM | MAX | UNIT |
|----------------------|--|-------------------|-----|-------------------|------|
| V _{CC} | Digital logic supply voltage (Core) | 1.14 | 1.2 | 1.32 | V |
| V _{CCPLL} | PLL supply voltage | 1.14 | 1.2 | 1.32 | V |
| V _{CCIO} | Digital logic supply voltage (I/O) | 3 | 3.3 | 3.6 | V |
| V _{CCAD} | MibADC supply voltage | 3 | | 5.25 | V |
| V _{CCP} | Flash pump supply voltage | 3 | 3.3 | 3.6 | V |
| V _{SS} | Digital logic supply ground | | 0 | | V |
| V _{SSAD} | MibADC supply ground | -0.1 | | 0.1 | V |
| V _{ADREFHI} | Analog-to-Digital (A-to-D) high-voltage reference source | V _{SSAD} | | V _{CCAD} | V |
| V _{ADREFLO} | A-to-D low-voltage reference source | V _{SSAD} | | V _{CCAD} | V |
| T _A | Operating free-air temperature | -40 | | 105 | °C |
| T _J | Operating junction temperature | -40 | | 130 | °C |

(1) All voltages are with respect to V_{SS}, except V_{CCAD}, which is with respect to V_{SSAD}.

5.5 Switching Characteristics over Recommended Operating Conditions for Clock Domains

Table 5-2. Clock Domain Timing Specifications

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|-------------------------|--|-----------------|-----|-------------------|------|
| f _{OSC} | OSC - oscillator clock frequency using an external crystal | | 5 | 20 | MHz |
| f _{GCLK1} | GCLK - R5F CPU clock frequency | | | 330 | MHz |
| f _{GCLK2} | GCLK - R5F CPU clock frequency | | | 330 | MHz |
| f _{HCLK} | HCLK - System clock frequency | | | 150 | MHz |
| f _{VCLK} | VCLK - Primary peripheral clock frequency | | | 110 | MHz |
| f _{VCLK2} | VCLK2 - Secondary peripheral clock frequency | | | 110 | MHz |
| f _{VCLK3} | VCLK3 - Secondary peripheral clock frequency | | | 150 | MHz |
| f _{VCLKA1} | VCLKA1 - Primary asynchronous peripheral clock frequency | | | 110 | MHz |
| f _{VCLKA2} | VCLKA2 - Secondary asynchronous peripheral clock frequency | | | 110 | MHz |
| f _{VCLKA4} | VCLKA4 - Secondary asynchronous peripheral clock frequency | | | 110 | MHz |
| f _{RTICK1} | RTICK1 - clock frequency | | | f _{VCLK} | MHz |
| f _{PROG/ERASE} | System clock frequency - flash programming/erase | | | f _{HCLK} | MHz |
| f _{ECLK} | External Clock 1 | | | 110 | MHz |
| f _{ETMCLKOUT} | ETM trace clock output | | | 55 | MHz |
| f _{ETMCLKIN} | ETM trace clock input | | | 110 | MHz |
| f _{EXTCLKIN1} | External input clock 1 | | | 110 | MHz |
| f _{EXTCLKIN2} | External input clock 2 | | | 110 | MHz |

Table 5-2 lists the maximum frequency of the CPU (GLKx), the level-2 memory (HCLK) and the peripheral clocks (VCLKx). It is not always possible to run each clock at its maximum frequency as GCLK must be an integral multiple of HCLK and HCLK must be an integral multiple of VCLKx. Depending on the system, the optimum performance may be obtained by maximizing either the CPU frequency, the level-two RAM interface, the level-two flash interface, or the peripherals.

5.6 Wait States Required - L2 Memories

Wait states are cycles the CPU must wait in order to retrieve data from the memories which have access times longer than a CPU clock. Memory wrapper, SCR interconnect and the CPU itself may introduce additional cycles of latency due to logic pipelining and synchronization. Therefore, the total latency cycles as seen by the CPU can be more than the number of wait states to cover the memory access time.

Figure 5-1 shows only the number of programmable wait states needed for L2 flash memory at different frequencies. The number of wait states is correlated to HCLK frequency. The clock ratio between CPU clock (GCLKx) and HCLK can vary. Therefore, the total number of wait states in terms of GCLKx can be obtained by taking the programmed wait states multiplied by the clock ratio.

There is no user programmable wait state for L2 SRAM access. L2 SRAM is clocked by HCLK and is limited to maximum 150 MHz.

Figure 5-1. Wait States Scheme

L2 flash is clocked by HCLK and is limited to maximum 150 MHz. The L2 flash can support zero data wait state up to 45 MHz.

5.7 Power Consumption Summary

Over Recommended Operating Conditions

| PARAMETER | | TEST CONDITIONS | MIN | TYP ⁽¹⁾ | MAX | UNIT |
|-----------------------|--|---|-----|--------------------|------------------------|------|
| I _{CC} | V _{CC} digital supply and PLL current (operating mode) | f _{GCLK} = 330 MHz, f _{HCLK} = 110 MHz, f _{VCLK} = 110 MHz, f _{VCLK2} = 110 MHz, f _{VCLK3} = 110 MHz | | 595 | 880 ⁽²⁾ | mA |
| | V _{CC} digital supply and PLL current (LBIST mode, or PBIST mode) | LBIST clock rate = 82.5 MHz PBIST ROM clock frequency = 55 MHz | | 970 | 1350 ⁽³⁾⁽⁴⁾ | mA |
| I _{CCIO} | V _{CCIO} digital supply current (operating mode) | No DC load, V _{CCmax} | | | 15 | mA |
| I _{CCAD} | V _{CCAD} supply current (operating mode) | Single ADC operational, V _{CCADmax} | | | 15 | mA |
| | | Single ADC power down, V _{CCADmax} | | | 5 | µA |
| | | Both ADCs operational, V _{CCADmax} | | | 30 | mA |
| I _{CCREF HI} | AD _{REFHI} supply current (operating mode) | Single ADC operational, AD _{REFHI} max | | | 5 | mA |
| | | Both ADCs operational, AD _{REFHI} max | | | 10 | mA |
| I _{CCP} | V _{CCP} pump supply current | Read operation of two banks in parallel, V _{CCPmax} | | | 70 | mA |
| | | Read from two banks and program or erase another bank, V _{CCPmax} | | | 93 | mA |

(1) The typical value is the average current for the nominal process corner and junction temperature of 25°C.

(2) The maximum I_{CC} value can be derated

- linearly with voltage
- by 1.7 mA/MHz for lower GCLK frequency when f_{GCLK} = 3 * f_{HCLK} = 3 * f_{VCLK}
- for lower junction temperature by the equation below where T_{JK} is the junction temperature in Kelvin and the result is in milliamperes.

$$283 - 0.2 e^{0.018T_{JK}}$$

(3) The maximum I_{CC} value can be derated

- linearly with voltage
- by 3.2 mA/MHz for lower GCLK frequency
- for lower junction temperature by the equation below where T_{JK} is the junction temperature in Kelvin and the result is in milliamperes.

$$283 - 0.2 e^{0.018T_{JK}}$$

(4) LBIST and PBIST currents are for a short duration, typically less than 10 ms. They are usually ignored for thermal calculations for the device and the voltage regulator.

5.8 Input/Output Electrical Characteristics Over Recommended Operating Conditions⁽¹⁾

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT | |
|-------------------------------------|---|--|----------------------------------|------|-------------------------|------|---------------|
| V_{hys} V_{IL} | Input hysteresis Low-level input voltage | All inputs | 180 | | | mV | |
| | | All inputs ⁽²⁾ | -0.3 | | 0.8 | V | |
| V_{IH} | High-level input voltage | All inputs ⁽²⁾ | 2 | | $V_{\text{CCIO}} + 0.3$ | V | |
| V_{OL} | Low-level output voltage | $I_{\text{OL}} = I_{\text{OLmax}}$ | | | $0.2 * V_{\text{CCIO}}$ | V | |
| | | $I_{\text{OL}} = 50 \mu\text{A}$, standard output mode | | | 0.2 | | |
| V_{OH} | High-level output voltage | $I_{\text{OH}} = I_{\text{OHmax}}$ | $0.8 * V_{\text{CCIO}}$ | | | V | |
| | | $I_{\text{OH}} = 50 \mu\text{A}$, standard output mode | $V_{\text{CCIO}} - 0.3$ | | | | |
| I_{IC} | Input clamp current (I/O pins) | $V_{\text{I}} < V_{\text{SSIO}} - 0.3$ or $V_{\text{I}} > V_{\text{CCIO}} + 0.3$ | -3.5 | | 3.5 | mA | |
| I_{I} | Input current (I/O pins) | I_{IH} Pulldown 20 μA | $V_{\text{I}} = V_{\text{CCIO}}$ | 5 | | 40 | μA |
| | | I_{IH} Pulldown 100 μA | $V_{\text{I}} = V_{\text{CCIO}}$ | 40 | | 195 | |
| | | I_{IL} Pullup 20 μA | $V_{\text{I}} = V_{\text{SS}}$ | -40 | | -5 | |
| | | I_{IL} Pullup 100 μA | $V_{\text{I}} = V_{\text{SS}}$ | -195 | | -40 | |
| | | All other pins | No pullup or pulldown | -1 | | 1 | |
| I_{OL} | Low-level output current | Pins with output buffers of 8 mA drive strength | V_{OLmax} | | | 8 | mA |
| | | Pins with output buffers of 4 mA drive strength | | | | 4 | |
| | | Pins with output buffers of 2 mA drive strength | | | | 2 | |
| I_{OH} | High-level output current | Pins with output buffers of 8 mA drive strength | V_{OLmin} | | | -8 | mA |
| | | Pins with output buffers of 4 mA drive strength | | | | -4 | |
| | | Pins with output buffers of 2 mA drive strength | | | | -2 | |
| C_{I} | Input capacitance | | | | 2 | pF | |
| C_{O} | Output capacitance | | | | 3 | pF | |

(1) Source currents (out of the device) are negative while sink currents (into the device) are positive.

(2) This does not apply to the nPORRST pin.

5.9 Thermal Resistance Characteristics for the BGA Package (ZWT)

Over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

| | | °C / W |
|------------------|---|--------|
| R _{θJA} | Junction-to-free air thermal resistance, still air (includes 5x5 thermal via cluster in 2s2p PCB connected to 1st ground plane) | 14.3 |
| R _{θJB} | Junction-to-board thermal resistance (includes 5x5 thermal via cluster in 2s2p PCB connected to 1st ground plane) | 5.49 |
| R _{θJC} | Junction-to-case thermal resistance (2s0p PCB) | 5.02 |
| Ψ _{JT} | Junction-to-package top, still air (includes 5x5 thermal via cluster in 2s2p PCB connected to 1st ground plane) | 0.29 |
| Ψ _{JB} | Junction-to-board, still air (includes 5x5 thermal via cluster in 2s2p PCB connected to 1st ground plane) | 6.41 |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report [SPRA953](#)

5.10 Timing and Switching Characteristics

5.10.1 Input Timings

Figure 5-2. TTL-Level Inputs

Table 5-3. Timing Requirements for Inputs⁽¹⁾

| | | MIN | MAX | UNIT |
|----------------|--|--------------------------|-----|------|
| t_{pw} | Input minimum pulse width | $t_{c(VCLK)} + 10^{(2)}$ | | ns |
| t_{in_slew} | Time for input signal to go from V_{IL} to V_{IH} or from V_{IH} to V_{IL} | | 1 | ns |

(1) $t_{c(VCLK)}$ = peripheral VBUS clock cycle time = $1 / f_{(VCLK)}$

(2) The timing shown above is only valid for pin used in general-purpose input mode.

5.10.2 Output Timings

Table 5-4. Switching Characteristics for Output Timings versus Load Capacitance (CL)

| PARAMETER | | MIN | MAX | UNIT | |
|------------------|-----------------------------|-------------|-------------|------|----|
| Rise time, t_r | 8 mA low EMI pins | CL = 15 pF | 2.5 | ns | |
| | | CL = 50 pF | 4 | | |
| | | CL = 100 pF | 7.2 | | |
| | | CL = 150 pF | 12.5 | | |
| Fall time, t_f | | CL = 15 pF | 2.5 | ns | |
| | | CL = 50 pF | 4 | | |
| | | CL = 100 pF | 7.2 | | |
| | | CL = 150 pF | 12.5 | | |
| Rise time, t_r | 4 mA low EMI pins | CL = 15 pF | 5.6 | ns | |
| | | CL = 50 pF | 10.4 | | |
| | | CL = 100 pF | 16.8 | | |
| | | CL = 150 pF | 23.2 | | |
| Fall time, t_f | | CL = 15 pF | 5.6 | ns | |
| | | CL = 50 pF | 10.4 | | |
| | | CL = 100 pF | 16.8 | | |
| | | CL = 150 pF | 23.2 | | |
| Rise time, t_r | 2 mA-z low EMI pins | CL = 15 pF | 8 | ns | |
| | | CL = 50 pF | 15 | | |
| | | CL = 100 pF | 23 | | |
| | | CL = 150 pF | 33 | | |
| Fall time, t_f | | CL = 15 pF | 8 | ns | |
| | | CL = 50 pF | 15 | | |
| | | CL = 100 pF | 23 | | |
| | | CL = 150 pF | 33 | | |
| Rise time, t_r | Selectable 8mA / 2mA-z pins | CL = 15 pF | 2.5 | ns | |
| | | CL = 50 pF | 4 | | |
| | | CL = 100 pF | 7.2 | | |
| | | CL = 150 pF | 12.5 | | |
| Fall time, t_f | | CL = 15 pF | 2.5 | ns | |
| | | CL = 50 pF | 4 | | |
| | | CL = 100 pF | 7.2 | | |
| | | CL = 150 pF | 12.5 | | |
| Rise time, t_r | | 2 mA-z mode | CL = 15 pF | 8 | ns |
| | | | CL = 50 pF | 15 | |
| | | | CL = 100 pF | 23 | |
| | | | CL = 150 pF | 33 | |
| Fall time, t_f | CL = 15 pF | | 8 | ns | |
| | CL = 50 pF | | 15 | | |
| | CL = 100 pF | | 23 | | |
| | CL = 150 pF | | 33 | | |

Figure 5-3. CMOS-Level Outputs

Table 5-5. Timing Requirements for Outputs⁽¹⁾

| | | MIN | MAX | UNIT |
|-------------------------------|--|-----|-----|------|
| $t_{d(\text{parallel_out})}$ | Delay between low to high, or high to low transition of general-purpose output signals that can be configured by an application in parallel, for example, all signals in a GIOA port, or all N2HET1 signals, and so forth. | | 6 | ns |

(1) This specification does not account for any output buffer drive strength differences or any external capacitive loading differences. Check for output buffer drive strength information on each signal.

6 System Information and Electrical Specifications

6.1 Device Power Domains

The device core logic is split up into multiple virtual power domains to optimize the power for a given application use case.

This device has six logic power domains: PD1, PD2, PD3, PD4, PD5, and PD6. PD1 is a domain which cannot turn off of its clocks at once through the Power-Management Module (PMM). However, individual clock domain operating in PD1 can be individually enabled or disabled through the SYS.CDDIS register. Each of the other power domains can be turned ON, IDLE or OFF as per the application requirement through the PMM module.

In this device, a power domain can operate in one of the three possible power states: ON, IDLE and OFF. ON state is the normal operating state where clocks are actively running in the power domain. When clocks are turned off, the dynamic current is removed from the power domain. In this device, both the IDLE and OFF states have the same power characteristic. When put into either the IDLE or the OFF state, only clocks are turned off from the power domain. Leakage current from the power domain still remains. Note that putting a power domain in the OFF state will not remove any leakage current in this device. In changing the power domain states, the user must poll the system status register to check the completion of the transition. From a programmer model perspective, all three power states are available from the PMM module.

The actual management of the power domains and the hand-shaking mechanism is managed by the PMM. Refer to the Power Management Module (PMM) chapter of the device technical reference manual for more details.

6.2 Voltage Monitor Characteristics

A voltage monitor is implemented on this device. The purpose of this voltage monitor is to eliminate the requirement for a specific sequence when powering up the core and I/O voltage supplies.

6.2.1 Important Considerations

- The voltage monitor does not eliminate the need of a voltage supervisor circuit to ensure that the device is held in reset when the voltage supplies are out of range.
- The voltage monitor only monitors the core supply (VCC) and the I/O supply (VCCIO). The other supplies are not monitored by the VMON. For example, if the VCCAD or VCCP are supplied from a source different from that for VCCIO, then there is no internal voltage monitor for the VCCAD and VCCP supplies.

6.2.2 Voltage Monitor Operation

The voltage monitor generates the Power Good MCU signal (PGMCU) as well as the I/Os Power Good IO signal (PGIO) on the device. During power-up or power-down, the PGMCU and PGIO are driven low when the core or I/O supplies are lower than the specified minimum monitoring thresholds. The PGIO and PGMCU being low isolates the core logic as well as the I/O controls during power up or power down of the supplies. This allows the core and I/O supplies to be powered up or down in any order.

When the voltage monitor detects a low voltage on the I/O supply, it will assert a power-on reset. When the voltage monitor detects an out-of-range voltage on the core supply, it asynchronously makes all output pins high impedance, and asserts a power-on reset. The I/O supply must be above the threshold for monitoring the core supply. The voltage monitor is disabled when the device enters a low power mode.

The VMON also incorporates a glitch filter for the nPORRST input. Refer to [Section 6.3.3.1](#) for the timing information on this glitch filter.

Table 6-1. Voltage Monitoring Specifications

| PARAMETER | | | MIN | TYP | MAX | UNIT |
|------------------|-------------------------------|--|------|-----|------|------|
| V _{MON} | Voltage monitoring thresholds | VCC low - VCC level below this threshold is detected as too low. | 0.75 | 0.9 | 1.13 | V |
| | | VCC high - VCC level above this threshold is detected as too high. | 1.40 | 1.7 | 2.1 | |
| | | VCCIO low - VCCIO level below this threshold is detected as too low. | 1.85 | 2.4 | 2.99 | |

6.2.3 Supply Filtering

The VMON has the capability to filter glitches on the VCC and VCCIO supplies.

[Table 6-2](#) lists the characteristics of the supply filtering. Glitches in the supply larger than the maximum specification cannot be filtered.

Table 6-2. VMON Supply Glitch Filtering Capability

| PARAMETER | MIN | MAX | UNIT |
|---|-----|------|------|
| Width of glitch on VCC that can be filtered | 250 | 1000 | ns |
| Width of glitch on VCCIO that can be filtered | 250 | 1000 | ns |

6.3 Power Sequencing and Power-On Reset

6.3.1 Power-Up Sequence

There is no timing dependency between the ramp of the VCCIO and the VCC supply voltage. The power-up sequence starts with the I/O voltage rising above the minimum I/O supply threshold, (for more details, see [Table 6-3](#)), core voltage rising above the minimum core supply threshold and the release of power-on reset. The high-frequency oscillator will start up first and its amplitude will grow to an acceptable level. The oscillator start-up time is dependent on the type of oscillator and is provided by the oscillator vendor. The different supplies to the device can be powered up in any order.

The device goes through the following sequential phases during power up.

Table 6-3. Power-Up Phases

| | |
|--|-------------------------------|
| Oscillator start-up and validity check | 1024 oscillator cycles |
| eFuse autoload | 3650 oscillator cycles |
| Flash pump power-up | 250 oscillator cycles |
| Flash bank power-up | 1460 oscillator cycles |
| Total | 6384 oscillator cycles |

The CPU reset is released at the end of the above sequence and fetches the first instruction from address 0x00000000.

6.3.2 Power-Down Sequence

The different supplies to the device can be powered down in any order.

6.3.3 Power-On Reset: nPORRST

This is the power-on reset. This reset must be asserted by an external circuitry whenever the I/O or core supplies are outside the specified recommended range. This signal has a glitch filter on it. It also has an internal pulldown.

6.3.3.1 nPORRST Electrical and Timing Requirements

Table 6-4. Electrical Requirements for nPORRST

| NO. | | MIN | MAX | UNIT |
|-----|------------------|--|-----|------------------|
| | V_{CCPORL} | V_{CC} low supply level when nPORRST must be active during power up | | 0.5 V |
| | V_{CCPORH} | V_{CC} high supply level when nPORRST must remain active during power up and become active during power down | | 1.14 V |
| | $V_{CCIOPORL}$ | V_{CCIO} / V_{CCP} low supply level when nPORRST must be active during power up | | 1.1 V |
| | $V_{CCIOPORH}$ | V_{CCIO} / V_{CCP} high supply level when nPORRST must remain active during power up and become active during power down | | 3.0 V |
| | $V_{IL(PORRST)}$ | Low-level input voltage of nPORRST $V_{CCIO} > 2.5 V$ | | $0.2 * V_{CCIO}$ |
| | | Low-level input voltage of nPORRST $V_{CCIO} < 2.5 V$ | | 0.5 |
| 3 | $t_{su(PORRST)}$ | Setup time, nPORRST active before V_{CCIO} and $V_{CCP} > V_{CCIOPORL}$ during power up | | 0 ms |
| 6 | $t_{h(PORRST)}$ | Hold time, nPORRST active after $V_{CC} > V_{CCPORH}$ | | 1 ms |
| 7 | $t_{su(PORRST)}$ | Setup time, nPORRST active before $V_{CC} < V_{CCPORH}$ during power down | | 2 μs |
| 8 | $t_{h(PORRST)}$ | Hold time, nPORRST active after V_{CCIO} and $V_{CCP} > V_{CCIOPORH}$ | | 1 ms |
| 9 | $t_{h(PORRST)}$ | Hold time, nPORRST active after $V_{CC} < V_{CCPORL}$ | | 0 ms |
| | $t_f(nPORRST)$ | Filter time nPORRST terminal; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset. Pulses greater than MIN but less than MAX may or may not generate a reset. | | 475 2000 ns |

A. Figure 6-1 shows that there is no timing dependency between the ramp of the V_{CCIO} and the V_{CC} supply voltages.

Figure 6-1. nPORRST Timing Diagram^(A)

6.4 Warm Reset (nRST)

This is a bidirectional reset signal. The internal circuitry drives the signal low on detecting any device reset condition. An external circuit can assert a device reset by forcing the signal low. On this terminal, the output buffer is implemented as an open drain (drives low only). To ensure an external reset is not arbitrarily generated, TI recommends that an external pullup resistor is connected to this terminal.

This terminal has a glitch filter. It also has an internal pullup

6.4.1 Causes of Warm Reset

Table 6-5. Causes of Warm Reset

| DEVICE EVENT | SYSTEM STATUS FLAG |
|-----------------------------------|--------------------------------------|
| Power-Up Reset | Exception Status Register, bit 15 |
| Oscillator fail | Global Status Register, bit 0 |
| PLL slip | Global Status Register, bits 8 and 9 |
| Watchdog exception | Exception Status Register, bit 13 |
| Debugger reset | Exception Status Register, bit 11 |
| CPU Reset (driven by the CPU STC) | Exception Status Register, bit 5 |
| Software Reset | Exception Status Register, bit 4 |
| External Reset | Exception Status Register, bit 3 |

6.4.2 nRST Timing Requirements

Table 6-6. nRST Timing Requirements⁽¹⁾

| | | MIN | MAX | UNIT |
|---------------|---|-------------------|------|------|
| $t_{v(RST)}$ | Valid time, nRST active after nPORRST inactive | 5032 $t_{c(OSC)}$ | | ns |
| | Valid time, nRST active (all other System reset conditions) | 32 $t_{c(VCLK)}$ | | |
| $t_{f(nRST)}$ | Filter time nRST terminal; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset | 475 | 2000 | ns |

(1) Specified values **do not** include rise/fall times. For rise and fall timings, see [Table 5-4](#).

6.5 ARM Cortex-R5F CPU Information

6.5.1 Summary of ARM Cortex-R5F CPU Features

The features of the ARM Cortex-R5F CPU include:

- An integer unit with integral Embedded ICE-RT logic.
- High-speed Advanced Microprocessor Bus Architecture (AMBA) Advanced eXtensible Interfaces (AXI) for Level two (L2) master and slave interfaces.
- Floating-Point Coprocessor
- Dynamic branch prediction with a global history buffer, and a 4-entry return stack
- Low interrupt latency.
- Nonmaskable interrupt.
- Harvard Level one (L1) memory system with:
 - 32KB of instruction cache and 32KB of data cache implemented. Both Instruction and data cache have ECC support.
 - ARMv7-R architecture Memory Protection Unit (MPU) with 16 regions
- Dual core logic for fault detection in safety-critical applications.
- L2 memory interface:
 - Single 64-bit master AXI interface
 - 64-bit slave AXI interface to cache memories
 - 32-bit AXI_Peripheral ports to support low latency peripheral ports
- Debug interface to a CoreSight Debug Access Port (DAP).
- Performance Monitoring Unit (PMU).
- Vectored Interrupt Controller (VIC) port.
- AXI accelerator coherency port (ACP) supporting IO coherency with write-through cacheable regions
- Ability to generate ECC on L2 data buses and parity of all control channels
- Both CPU cores in lock-step
- Eight hardware breakpoints
- Eight watchpoints

6.5.2 Dual Core Implementation

The device has two Cortex-R5F cores, where the output signals of both CPUs are compared in the CCM-R5F unit. To avoid common mode impacts the signals of the CPUs to be compared are delayed by two clock cycles as shown in [Figure 6-2](#).

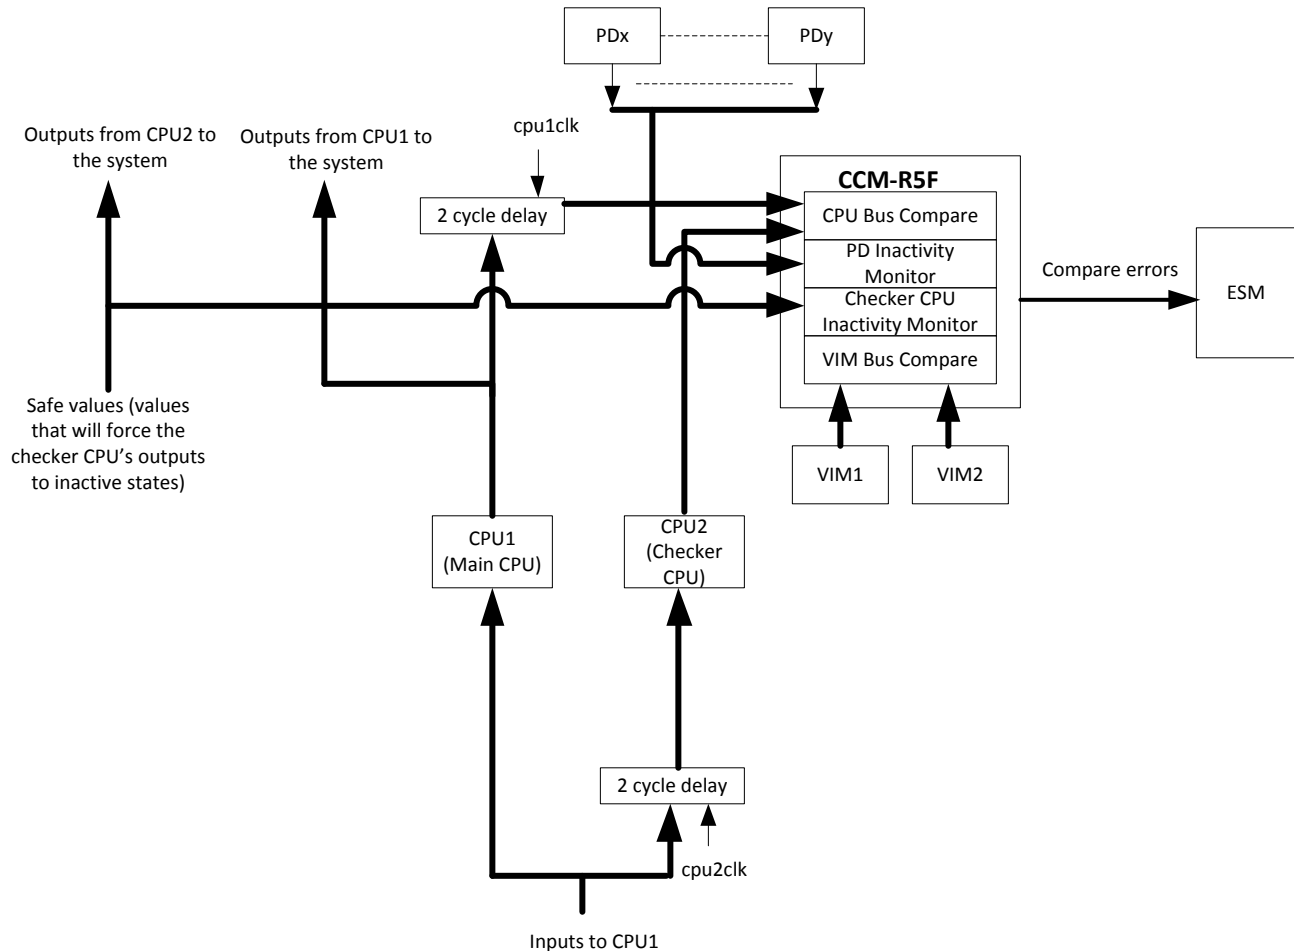

Figure 6-2. Dual Core Implementation

6.5.3 Duplicate Clock Tree After GCLK

The CPU clock domain is split into two clock trees, one for each CPU, with the clock of the second CPU running at the same frequency and in phase to the clock of CPU1. See [Figure 6-2](#).

6.5.4 ARM Cortex-R5F CPU Compare Module (CCM) for Safety

CCM-R5F has two major functions. One is to compare the outputs of two Cortex-R5F processor cores and the VIM modules. The second function is inactivity monitoring, to detect any faulted transaction initiated by the checker core.

6.5.4.1 Signal Compare Operating Modes

The CCM-R5F module runs in one of four operating modes - active compare lockstep, self-test, error forcing, and self-test error forcing mode. To select an operating mode, a dedicated key must be written to the key register. CPU compare block and VIM compare block have separate key registers to select their operating modes. Status registers are also separate for these blocks.

6.5.4.1.1 Active Compare Lockstep Mode

In this mode the output signals of both CPUs and both VIMs are compared, and a difference in the outputs is indicated by the compare_error terminal. For more details about CPU and VIM lockstep comparison, refer to the device technical reference manual.

CCM-R5F also produces a signal to ESM GP1.92 to indicate its current status whether it is out of lockstep or is in self-test mode. This ensures that any lock step fault is reported to the CPU.

6.5.4.1.2 Self-Test Mode

In self-test mode the CCM-R5F is checked for faults, by applying internally generated, series of test patterns to look for any hardware faults inside the module. During self-test the compare error signal is deactivated. If a fault on the CCM-R5F module is detected, an error is shown on the selftest_error pin.

6.5.4.1.3 Error Forcing Mode

In error forcing mode a test pattern is applied to the CPU and VIM related inputs of the compare logic to force an error at the compare error signal of the compare unit. Error forcing mode is done separately for VIM signal compare block and CPU signal compare block. For each block, this mode is enabled by writing the key in corresponding block's key register.

6.5.4.1.4 Self-Test Error Forcing Mode

In self-test error forcing mode an error is forced at the self-test error signal. The compare block is still running in lockstep mode and the key is switched to lockstep after one clock cycle.

Table 6-7. CPU Compare Self-Test Cycles

| MODE | NUMBER OF GCLK CYCLES |
|------------------------------|-----------------------|
| Self-Test Mode | 4947 |
| Self-Test Error Forcing Mode | 1 |
| Error Forcing Mode | 1 |

Table 6-8. VIM Compare Self-Test Cycles

| MODE | NUMBER OF VCLK CYCLES |
|------------------------------|-----------------------|
| Self-Test Mode | 151 |
| Self-Test Error Forcing Mode | 1 |
| Error Forcing Mode | 1 |

6.5.4.2 Bus Inactivity Monitor

CCM-R5F also monitors the inputs to the interconnect coming from the checker Cortex-R5F core. The input signals to the interconnect are compared against their default clamped values. The checker core must not generate any bus transaction to the interconnect system as all bus transactions are carried out through the main CPU core. If any signal value is different from its clamped value, an error signal is generated. The error response in case of a detected transaction is sent to ESM.

In addition to bus monitoring the checker CPU core, the CCM-R5F will also monitor several other critical signals from other masters residing in other power domains. This is to ensure an inadvertent bus transaction from an unused power domain can be detected. To enable detection of unwanted transaction from an unused master, the power domain in which the master to be monitored will need to be configured in OFF power state through the PMM module.

6.5.4.3 CPU Registers Initialization

To avoid an erroneous CCM-R5F compare error, the application software must ensure that the CPU registers of both CPUs are initialized with the same values before the registers are used, including function calls where the register values are pushed onto the stack.

Example routine for CPU register initialization:

```

.text
.state32
.global __clearRegisters_
.asmfunc
__clearRegisters_:

6.5.5 CPU Self-Test

The CPU STC (Self-Test Controller) is used to test the two Cortex-R5F CPU Cores using the Deterministic Logic BIST Controller as the test engine.

The main features of the self-test controller are:

- Ability to divide the complete test run into independent test intervals
- Capable of running the complete test as well as running few intervals at a time
- Ability to continue from the last executed interval (test set) as well as ability to restart from the beginning (First test set)
- Complete isolation of the self-tested CPU core from rest of the system during the self-test run
- Ability to capture the Failure interval number
- Time-out counter for the CPU self-test run as a fail-safe feature

6.5.5.1 Application Sequence for CPU Self-Test

1. Configure clock domain frequencies.
2. Select number of test intervals to be run.
3. Configure the time-out period for the self-test run.
4. Enable self-test.
5. Wait for CPU reset.
6. In the reset handler, read CPU self-test status to identify any failures.
7. Retrieve CPU state if required.

For more information see the device technical reference manual.

6.5.5.2 CPU Self-Test Clock Configuration

The maximum clock rate for the self-test is 110 MHz. The STCCLK is divided down from the CPU clock. This divider is configured by the STCCLKDIV register at address 0xFFFFE644.

For more information see the device-specific Technical Reference Manual.

6.5.5.3 CPU Self-Test Coverage

The self-test, if enabled, is automatically applied to the entire processor group. Self-test will only start when nCLKSTOPPEDm is asserted which indicates the CPU cores and the ACP interface are in quiescent state. While the processor group is in self-test, other masters can still function normally including accesses to the system memory such as the L2 SRAM. Because uSCU is part of the processor group under self-test, the cache coherency checking will be bypassed.

When the self-test is completed, reset is asserted to all logic subjected to self-test. After self-test is complete, software must invalidate the cache accordingly.

The default value of the CPU LBIST clock prescaler is 'divide-by-1'. A prescaler in the STC module can be used to configure the CPU LBIST frequency with respect to the CPU GCLK frequency.

[Table 6-9](#) lists the CPU test coverage achieved for each self-test interval. It also lists the cumulative test cycles. The test time can be calculated by multiplying the number of test cycles with the STC clock period.

Table 6-9. CPU Self-Test Coverage

| INTERVALS | TEST COVERAGE, % | TEST CYCLES |
|-----------|------------------|-------------|
| 0 | 0 | 0 |
| 1 | 56.85 | 1629 |
| 2 | 64.19 | 3258 |
| 3 | 68.76 | 4887 |
| 4 | 71.99 | 6516 |
| 5 | 75 | 8145 |
| 6 | 76.61 | 9774 |
| 7 | 78.08 | 11403 |
| 8 | 79.2 | 13032 |
| 9 | 80.18 | 14661 |
| 10 | 81.03 | 16290 |

| 36 | 89.55 | 58644 |
| 37 | 89.7 | 60273 |
| 38 | 89.83 | 61902 |
| 39 | 89.96 | 63531 |
| 40 | 90.1 | 65160 |

6.5.6 N2HET STC / LBIST Self-Test Coverage

Logic BIST self-test capability for N2HETs is available in this device. The STC2 can be configured to perform self-test for both N2HETs at the same time or one at the time. The default value of the N2HET LBIST clock prescaler is divide-by-1. However, the maximum clock rate for the N2HET STC / LBIST is VCLK/2. N2HET STC test should not be executed concurrently with CPU STC test.

Table 6-10. N2HET Self-Test Coverage

| INTERVALS | TEST COVERAGE, % | TEST CYCLES |
|-----------|------------------|-------------|
| 0 | 0 | 0 |
| 1 | 70.01 | 1365 |
| 2 | 77.89 | 2730 |
| 3 | 81.73 | 4095 |
| 4 | 84.11 | 5460 |
| 5 | 86.05 | 6825 |
| 6 | 87.78 | 8190 |
| 7 | 88.96 | 9555 |
| 8 | 89.95 | 10920 |
| 9 | 90.63 | 12285 |

6.6 Clocks

6.6.1 Clock Sources

Table 6-11 lists the available clock sources on the device. Each clock source can be enabled or disabled using the CSDISx registers in the system module. The clock source number in the table corresponds to the control bit in the CSDISx register for that clock source.

Table 6-11 also lists the default state of each clock source.

Table 6-11. Available Clock Sources

| CLOCK SOURCE NO. | NAME | DESCRIPTION | DEFAULT STATE |
|------------------|-----------|--|---------------|
| 0 | OSCIN | Main Oscillator | Enabled |
| 1 | PLL1 | Output From PLL1 | Disabled |
| 2 | Reserved | Reserved | Disabled |
| 3 | EXTCLKIN1 | External Clock Input 1 | Disabled |
| 4 | CLK80K | Low-Frequency Output of Internal Reference Oscillator | Enabled |
| 5 | CLK10M | High-Frequency Output of Internal Reference Oscillator | Enabled |
| 6 | PLL2 | Output From PLL2 | Disabled |
| 7 | EXTCLKIN2 | External Clock Input 2 | Disabled |

6.6.1.1 Main Oscillator

The oscillator is enabled by connecting the appropriate fundamental resonator/crystal and load capacitors across the external OSCIN and OSCOUT pins as shown in Figure 6-3. The oscillator is a single-stage inverter held in bias by an integrated bias resistor. This resistor is disabled during leakage test measurement and low power modes.

NOTE

TI strongly encourages each customer to submit samples of the device to the resonator/crystal vendors for validation. The vendors are equipped to determine which load capacitors will best tune their resonator/crystal to the microcontroller device for optimum start-up and operation over temperature and voltage extremes.

An external oscillator source can be used by connecting a 3.3-V clock signal to the OSCIN terminal and leaving the OSCOUT terminal unconnected (open) as shown in Figure 6-3.

Note A: The values of C1 and C2 should be provided by the resonator/crystal vendor.

Note B: Kelvin_GND should not be connected to any other GND.

Figure 6-3. Recommended Crystal/Clock Connection

6.6.1.1.1 Timing Requirements for Main Oscillator

Table 6-12. Timing Requirements for Main Oscillator

| | | MIN | NOM | MAX | UNIT |
|-------------------|---|-----|-----|-----|------|
| $t_{c(OSC)}$ | Cycle time, OSCIN (when using a sine-wave input) | 50 | | 200 | ns |
| $t_{c(OSC_SQR)}$ | Cycle time, OSCIN, (when input to the OSCIN is a square wave) | 50 | | 200 | ns |
| $t_w(OSCIL)$ | Pulse duration, OSCIN low (when input to the OSCIN is a square wave) | 15 | | | ns |
| $t_w(OSCIH)$ | Pulse duration, OSCIN high (when input to the OSCIN is a square wave) | 15 | | | ns |

6.6.1.2 Low-Power Oscillator

The Low-Power Oscillator (LPO) is comprised of two oscillators — HF LPO and LF LPO, in a single macro.

6.6.1.2.1 Features

The main features of the LPO are:

- Supplies a clock at extremely low power to reduce power consumption. This is connected as clock source 4 of the Global Clock Module (GCM).
- Supplies a high-frequency clock for nontiming-critical systems. This is connected as clock source 5 of the GCM.
- Provides a comparison clock for the crystal oscillator failure detection circuit.

Figure 6-4. LPO Block Diagram

Figure 6-4 shows a block diagram of the internal reference oscillator. This is a low-power oscillator (LPO) and provides two clock sources: one nominally 80 kHz and one nominally 10 MHz.

6.6.1.2.2 LPO Electrical and Timing Specifications

Table 6-13. LPO Specifications

| PARAMETER | | MIN | TYP | MAX | UNIT |
|---------------------|--|-------|------|-------|---------|
| Clock detection | Oscillator fail frequency - lower threshold, using untrimmed LPO output | 1.375 | 2.4 | 4.875 | MHz |
| | Oscillator fail frequency - higher threshold, using untrimmed LPO output | 22 | 38.4 | 78 | MHz |
| LPO - HF oscillator | Untrimmed frequency | 5.5 | 9 | 19.5 | MHz |
| | Trimmed frequency | 8.0 | 9.6 | 11.0 | MHz |
| | Start-up time from STANDBY (LPO BIAS_EN high for at least 900 μ s) | | | 10 | μ s |
| | Cold start-up time | | | 900 | μ s |
| LPO - LF oscillator | Untrimmed frequency | 36 | 85 | 180 | kHz |
| | Start-up time from STANDBY (LPO BIAS_EN high for at least 900 μ s) | | | 100 | μ s |
| | Cold start-up time | | | 2000 | μ s |

6.6.1.3 Phase-Locked Loop (PLL) Clock Modules

The PLL is used to multiply the input frequency to some higher frequency.

The main features of the PLL are:

- Frequency modulation can be optionally superimposed on the synthesized frequency of PLL1. The frequency modulation capability of PLL2 is permanently disabled.
- Configurable frequency multipliers and dividers
- Built-in PLL Slip monitoring circuit
- Option to reset the device on a PLL slip detection

6.6.1.3.1 Block Diagram

Figure 6-5 shows a high-level block diagram of the two PLL macros on this microcontroller. PLLCTL1 and PLLCTL2 are used to configure the multiplier and dividers for the PLL1. PLLCTL3 is used to configure the multiplier and dividers for PLL2.

Figure 6-5. ZWT PLLx Block Diagram

6.6.1.3.2 PLL Timing Specifications

Table 6-14. PLL Timing Specifications

| PARAMETER | | MIN | MAX | UNIT |
|--------------------------|---|-----|-----|------|
| f _{INTCLK} | PLL1 Reference Clock frequency | 1 | 20 | MHz |
| f _{post_ODCLK} | Post-ODCLK – PLL1 Post-divider input clock frequency | | 400 | MHz |
| f _{VCOCLK} | VCOCLK – PLL1 Output Divider (OD) input clock frequency | | 550 | MHz |
| f _{INTCLK2} | PLL2 Reference Clock frequency | 1 | 20 | MHz |
| f _{post_ODCLK2} | Post-ODCLK – PLL2 Post-divider input clock frequency | | 400 | MHz |
| f _{VCOCLK2} | VCOCLK – PLL2 Output Divider (OD) input clock frequency | | 550 | MHz |

6.6.1.4 External Clock Inputs

The device supports up to two external clock inputs. This clock input must be a square-wave input. [Table 6-15](#) specifies the electrical and timing requirements for these clock inputs.

Table 6-15. External Clock Timing and Electrical Specifications

| PARAMETER | | MIN | MAX | UNIT |
|--------------------|--------------------------------|------|------------------|------|
| $f_{EXTCLKx}$ | External clock input frequency | | 80 | MHz |
| $t_{w(EXTCLKIN)H}$ | EXTCLK high-pulse duration | 6 | | ns |
| $t_{w(EXTCLKIN)L}$ | EXTCLK low-pulse duration | 6 | | ns |
| $V_{IL(EXTCLKIN)}$ | Low-level input voltage | -0.3 | 0.8 | V |
| $V_{IH(EXTCLKIN)}$ | High-level input voltage | 2 | $V_{CCIO} + 0.3$ | V |

6.6.2 Clock Domains

6.6.2.1 Clock Domain Descriptions

Table 6-16 lists the device clock domains and their default clock sources. Table 6-16 also lists the system module control register that is used to select an available clock source for each clock domain.

Table 6-16. Clock Domain Descriptions

| CLOCK DOMAIN | CLOCK DISABLE BIT | DEFAULT SOURCE | SOURCE SELECTION REGISTER | SPECIAL CONSIDERATIONS |
|--------------|-------------------|----------------|---------------------------|---|

| VCLKA4_DIVR | SYS.VCLKACON1.20 | VCLK | SYS.VCLKACON1[19:16] | <ul style="list-style-type: none"> Divided down from VCLKA4 using the VCLKA4R field of the VCLKACON1 register Frequency can be VCLKA4/1, VCLKA4/2, ..., or VCLKA4/8 Default frequency is VCLKA4/2 Is disabled separately through the VCLKA4_DIV_CDDIS bit in the VCLKACON1 register, if the VCLKA4 is not already disabled |
| RTICK1 | SYS.CDDIS.6 | VCLK | SYS.RCLKSRC[3:0] | <ul style="list-style-type: none"> Defaults to VCLK as the source If a clock source other than VCLK is selected for RTICK1, then the RTICK1 frequency must be less than or equal to VCLK/3 Application can ensure this by programming the RT1DIV field of the RCLKSRC register, if necessary Is disabled through the CDDISx registers bit 6 |

6.6.2.2 Mapping of Clock Domains to Device Modules

Each clock domain has a dedicated functionality as shown in Figure 6-6.

Figure 6-6. Device Clock Domains

6.6.3 Special Clock Source Selection Scheme for VCLKA4_DIVR_EMAC

The MII interface requires VCLKA4_DIVR_EMAC to be 25 MHz and the RMII requires VCLKA4_DIVR_EMAC to be 50 MHz.

These different frequencies are supported by adding special dedicated clock source selection options for the VCLKA4_DIVR_EMAC clock domain. This logic is shown in Figure 6-7.

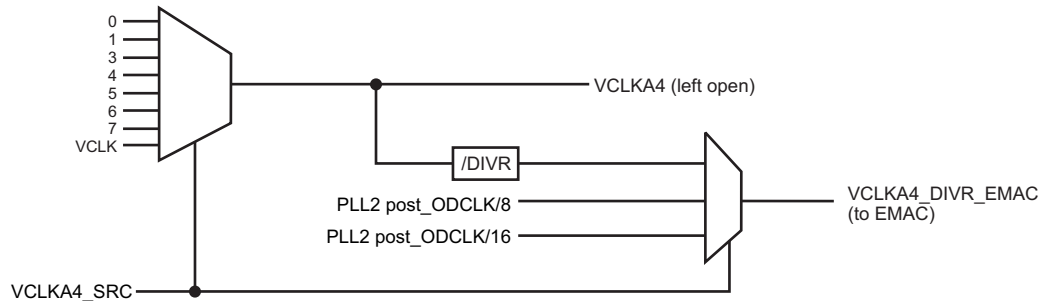

Figure 6-7. VCLKA4_DIVR Source Selection Options

The PLL2 post_ODCLK is brought out as a separate output from the PLL wrapper module. There are two additional dividers implemented at the device-level to divide this PLL2 post_ODCLK by 8 and by 16.

As shown in Figure 6-7, the VCLKA4_SRC configured through the system module VCLKACON1 control register is used to determine the clock source for the VCLKA4 and VCLKA4_DIVR. An additional multiplexor is implemented to select between the VCLKA4_DIVR and the two additional clock sources – PLL2 post_ODCLK/8 and post_ODCLK/16.

Table 6-17 lists the VCLKA4_DIVR_EMAC clock source selections.

Table 6-17. VCLKA4_DIVR_EMAC Clock Source Selection

| VCLKA4_SRC FROM VCLKACON1[19–16] | CLOCK SOURCE FOR VCLKA4_DIVR_EMAC |
|----------------------------------|-----------------------------------|
| 0x0 | OSCIN / VCLKA4R |
| 0x1 | PLL1CLK / VCLKA4R |

| 0x8–0xD | VCLK |
| 0xE | PLL2 post_ODCLK/8 |
| 0xF | PLL2 post_ODCLK/16 |

6.6.4 Clock Test Mode

The RM57Lx platform architecture defines a special mode that allows various clock signals to be selected and output on the ECLK1 terminal and N2HET1[12] device outputs. This special mode, Clock Test Mode, is very useful for debugging purposes and can be configured through the CLKTEST register in the system module. See [Table 6-18](#) and [Table 6-19](#) for the CLKTEST bits value and signal selection.

Table 6-18. Clock Test Mode Options for Signals on ECLK1

| SEL_ECP_PIN = CLKTEST[4-0] | SIGNAL ON ECLK1 |

6.7 Clock Monitoring

The LPO Clock Detect (LPOCLKDET) module consists of a clock monitor (CLKDET) and an internal LPO.

The LPO provides two different clock sources – a low frequency (CLK80K) and a high frequency (CLK10M).

The CLKDET is a supervisor circuit for an externally supplied clock signal (OSCIN). In case the OSCIN frequency falls out of a frequency window, the CLKDET flags this condition in the global status register (GLBSTAT bit 0: OSC FAIL) and switches all clock domains sourced by OSCIN to the CLK10M clock (limp mode clock).

The valid OSCIN frequency range is defined as: $f_{\text{CLK10M}} / 4 < f_{\text{OSCIN}} < f_{\text{CLK10M}} * 4$.

6.7.1 Clock Monitor Timings

Figure 6-8. LPO and Clock Detection, Untrimmed CLK10M

6.7.2 External Clock (ECLK) Output Functionality

The ECLK1/ECLK2 terminal can be configured to output a prescaled clock signal indicative of an internal device clock. This output can be externally monitored as a safety diagnostic.

6.7.3 Dual Clock Comparators

The Dual Clock Comparator (DCC) module determines the accuracy of selectable clock sources by counting the pulses of two independent clock sources (counter 0 and counter 1). If one clock is out of spec, an error signal is generated. For example, the DCC1 can be configured to use CLK10M as the reference clock (for counter 0) and VCLK as the "clock under test" (for counter 1). This configuration allows the DCC1 to monitor the PLL output clock when VCLK is using the PLL output as its source.

An additional use of this module is to measure the frequency of a selectable clock source. For example, the reference clock is connected to Counter 0 and the signal to be measured is connected to Counter 1. Counter 0 is programmed with a start value of known time duration (measurement time) from the reference clock. Counter 1 is programmed with a maximum start value. Start both counter simultaneously. When Counter 0 decrements to zero, both counter will stop and an error signal is generated if Counter 1 does not reach zero. The frequency of the input signals can be calculated from the count value of Counter 1 and the measurement time.

6.7.3.1 Features

- Takes two different clock sources as input to two independent counter blocks.
- One of the clock sources is the known-good, or reference clock; the second clock source is the "clock under test."
- Each counter block is programmable with initial, or seed values.
- The counter blocks start counting down from their seed values at the same time; a mismatch from the expected frequency for the clock under test generates an error signal which is used to interrupt the CPU.

6.7.3.2 Mapping of DCC Clock Source Inputs

Table 6-20. DCC1 Counter 0 Clock Sources

| CLOCK SOURCE[3:0] | CLOCK NAME |
|-------------------|--------------------|
| Others | Oscillator (OSCIN) |
| 0x5 | High-frequency LPO |
| 0xA | Test clock (TCK) |

Table 6-21. DCC1 Counter 1 Clock Sources

| KEY[3:0] | CLOCK SOURCE[3:0] | CLOCK NAME |
|----------|-------------------|------------------------------------|
| Others | – | N2HET1[31] |
| | 0x0 | Main PLL free-running clock output |
| | 0x1 | PLL #2 free-running clock output |
| | 0x2 | Low-frequency LPO |
| 0xA | 0x3 | High-frequency LPO |
| | 0x4 | Reserved |
| | 0x5 | EXTCLKIN1 |
| | 0x6 | EXTCLKIN2 |
| | 0x7 | Reserved |
| | 0x8 - 0xF | VCLK |

Table 6-22. DCC2 Counter 0 Clock Sources

| CLOCK SOURCE[3:0] | CLOCK NAME |
|-------------------|--------------------|
| Others | Oscillator (OSCIN) |
| 0xA | Test clock (TCK) |

Table 6-23. DCC2 Counter 1 Clock Sources

| KEY[3:0] | CLOCK SOURCE[3:0] | CLOCK NAME |
|----------|-------------------|--------------------|
| Others | – | N2HET2[0] |
| 0xA | 0x1 | PLL2_post_ODCLK/8 |
| | 0x2 | PLL2_post_ODCLK/16 |
| | 0x3 - 0x7 | Reserved |
| | 0x8 - 0xF | VCLK |

6.8 Glitch Filters

Table 6-24 lists the signals with glitch filters present .

Table 6-24. Glitch Filter Timing Specifications

| TERMINAL | PARAMETER | | MIN | MAX | UNIT |
|----------|------------------|---|-----|------|------|
| nPORRST | $t_{f(nPORRST)}$ | Filter time nPORRST terminal; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset ⁽¹⁾ | 475 | 2000 | ns |
| nRST | $t_{f(nRST)}$ | Filter time nRST terminal; pulses less than MIN will be filtered out, pulses greater than MAX will generate a reset | 475 | 2000 | ns |
| TEST | $t_{f(TEST)}$ | Filter time TEST terminal; pulses less than MIN will be filtered out, pulses greater than MAX will pass through | 475 | 2000 | ns |

- (1) The glitch filter design on the nPORRST signal is designed such that no size pulse will reset any part of the microcontroller (flash pump, I/O pins, forth) without also generating a valid reset signal to the CPU.

6.9.3 Special Consideration for CPU Access Errors Resulting in Imprecise Aborts

Any CPU write access to a Normal or Device type memory, which generates a fault, will generate an imprecise abort. The imprecise abort exception is disabled by default and must be enabled for the CPU to handle this exception. The imprecise abort handling is enabled by clearing the "A" bit in the CPU program status register (CPSR).

6.9.4 Master/Slave Access Privileges

Table 6-26 and Table 6-27 list the access permissions for each bus master on the device. A bus master is a module that can initiate a read or a write transaction on the device.

Each slave module on either the CPU Interconnect Subsystem or the Peripheral Interconnect Subsystem is listed in Table 6-27. Allowed indicates that the module listed in the MASTERS column can access that slave module.

Table 6-26. Bus Master / Slave Access Matrix for CPU Interconnect Subsystem

| MASTERS | SLAVES ON CPU INTERCONNECT SUBSYSTEM | | | | |
|-----------|--------------------------------------|-------------|---------|--------------|-------------|
| | L2 Flash OTP, ECC, Bank 7 (EEPROM) | L2 FLASH | L2 SRAM | CACHE MEMORY | EMIF |
| CPU Read | Allowed | Allowed | Allowed | Allowed | Allowed |
| CPU Write | Not allowed | Not allowed | Allowed | Allowed | Allowed |

| 9 | DAP | Allowed | Allowed | Allowed | Allowed |
| 10 | EMAC | Not allowed | Allowed | Not allowed | Not allowed |

6.9.4.1 Special Notes on Accesses to Certain Slaves

By design only the CPU and debugger can have privileged write access to peripherals under the PCR1 segment. The other masters can only read from these registers.

The master-id filtering check is implemented inside each PCR module of each peripheral segment and can be used to block certain masters from write accesses to certain peripherals. An unauthorized master write access detected by the PCR will result in the transaction being discarded and an error being generated to the ESM module.

The device contains dedicated logic to generate a bus error response on any access to a module that is in a power domain that has been turned off.

6.9.5 MasterID to PCR_x

The MasterID associated with each master port on the Peripheral Interconnect Subsystem contains a 4-bit value. The MasterID is passed along with the address and control signals to three PCR modules. PCR decodes the address and control signals to select the peripheral. In addition, it decodes this 4-bit MasterID value to perform memory protection. With 4-bit of MasterID, it allows the PCR to distinguish among 16 different masters to allow or disallow access to a given peripheral. Associated with each peripheral a 16-

bit MasterID access protection register is defined. Each bit grants or denies the permission of the corresponding binary coded decimal MasterID. For example, if bit 5 of the access permission register is set, it grants MasterID 5 to access the peripheral. If bit 7 is clear, it denies MasterID 7 to access the peripheral. Figure 6-10 shows the MasterID filtering scheme. Table 6-27 lists the MasterID of each master, which can access the PCRx.

Figure 6-10. PCR MasterID Filtering

6.9.6 CPU Interconnect Subsystem SDC MMR Port

The CPU Interconnect Subsystem SDC MMR Port is a special slave to the Peripheral Interconnect Subsystem. It is memory mapped at starting address of 0xFA00_0000. Various status registers pertaining to the diagnostics of the CPU Interconnect Subsystem can be access through this slave port. The CPU Interconnect Subsystem contains built-in hardware diagnostic checkers which will constantly watch transactions flowing through the interconnect. There is a checker for each master and slave attached to the CPU Interconnect Subsystem. The checker checks the expected behavior against the generated behavior by the interconnect. For example, if the CPU issues a burst read request to the flash, the checker will ensure that the expected behavior is indeed a burst read request to the proper slave module. If the interconnects generates a transaction which is not a read, or not a burst or not to the flash as the destination, then the checker will flag it one of the registers. The detected error will also be signaled to the ESM module. Refer to the Interconnect chapter of the TRM [SPNU562](#) for details on the registers.

Table 6-28. CPU Interconnect Subsystem SDC Register Bit Field Mapping

| Register name | bit 0 | bit 1 | bit 2 | bit 3 | bit 4 | bit 5 | bit 6 | Remark |

6.9.7 Parameter Overlay Module (POM) Considerations

The Parameter Overlay Module (POM) is implemented as part of the L2FMC module. It is used to redirect flash memory accesses to external memory interfaces or internal SRAM. The POM has an OCP master port to redirect accesses. The POM MMRs are located in a separate block and read/writes will happen through the Debug APB port on the L2FMC. The POM master port is capable of read accesses only. Inside the CPU Subsystem SCR, the POM master port is connected to both the L2RAMW and EMIF slaves. The primary roles of the POM are:

- The POM snoops the access on the two flash slave ports to determine if access should be remapped or not. It supports 32 regions among the two slave ports.
- If access is to be remapped, then the POM kills the access to the flash bank, and instead redirects the access through its own master.
- Upon obtaining response, the POM populates the response FIFO of the respective port so that the response is delivered back to the original requester.
- The access is unaffected if the request is not mapped to any region, or if the POM is disabled.
- The POM does not add any latency to the flash access when it is turned off.
- The POM does not add any latency to the remapped access (except the latency, if any, associated with the getting the response from the an alternate slave)

6.10 Flash Memory

6.10.1 Flash Memory Configuration

Flash Bank: A separate block of logic consisting of 1 to 16 sectors. Each flash bank normally has a customer-OTP and a TI-OTP area. These flash sectors share input/output buffers, data paths, sense amplifiers, and control logic.

Flash Sector: A contiguous region of flash memory which must be erased simultaneously due to physical construction constraints.

Flash Pump: A charge pump which generates all the voltages required for reading, programming, or erasing the flash banks.

Flash Module: Interface circuitry required between the host CPU and the flash banks and pump module.

Table 6-29. Flash Memory Banks and Sectors

| MEMORY ARRAYS (OR BANKS) | SECTOR NO. | SEGMENT | LOW ADDRESS | HIGH ADDRESS |
|--------------------------|------------|---------|-------------|--------------|
| BANK0 (2.0MB) | 0 | 16KB | 0x0000_0000 | 0x0000_3FFF |

| | " | " | " | " |
| | 31 | 4KB | 0xF021_F000 | 0xF021_FFFF |

6.10.2 Main Features of Flash Module

- Support for multiple flash banks for program and/or data storage
- Simultaneous read accesses on two banks while performing program or erase operation on any other bank
- Integrated state machines to automate flash erase and program operations
- Software interface for flash program and erase operations
- Pipelined mode operation to improve instruction access interface bandwidth
- Support for Single Error Correction Double Error Detection (SECCDED) block inside Cortex-R5F CPU
- Support for a rich set of diagnostic features

6.10.3 ECC Protection for Flash Accesses

All accesses to the L2 program flash memory are protected by SECCDED logic embedded inside the CPU. The flash module provides 8 bits of ECC code for 64 bits of instructions or data fetched from the flash memory. The CPU calculates the expected ECC code based on the 64 bits data received and compares it with the ECC code returned by the flash module. A single-bit error is corrected and flagged by the CPU, while a multibit error is only flagged. The CPU signals an ECC error through its Event bus. This signaling mechanism is not enabled by default and must be enabled by setting the 'X' bit of the Performance Monitor Control Register, c9.

```

MRC p15,#0,r1,c9,c12,#0      ;Enabling Event monitor states
ORR r1, r1, #0x00000010
MCR p15,#0,r1,c9,c12,#0      ;Set 4th bit ('X') of PMNC register
MRC p15,#0,r1,c9,c12,#0

```

NOTE

ECC is permanently enabled in the CPU L2 interface.

6.10.4 Flash Access Speeds

For information on flash memory access speeds and the relevant wait states required, refer to [Section 5.6](#).

6.10.5 Flash Program and Erase Timings

6.10.5.1 Flash Program and Erase Timings for Program Flash

Table 6-31. Timing Requirements for Program Flash

| | | MIN | NOM | MAX | UNIT |
|-----------------------------------|--|----------------------------------|-----|------|---------------|
| $t_{\text{prog}(288\text{bits})}$ | Wide Word (288-bits) programming time | | 40 | 300 | μs |
| $t_{\text{prog}(\text{Total})}$ | 4.0MB programming time ⁽¹⁾ | –40°C to 105°C | | 21.3 | s |
| | | 0°C to 60°C, for first 25 cycles | 5.3 | 10.6 | s |
| t_{erase} | Sector/Bank erase time | –40°C to 105°C | 0.3 | 4 | s |
| | | 0°C to 60°C, for first 25 cycles | | 100 | ms |
| t_{wec} | Write/erase cycles with 15-year Data Retention requirement | –40°C to 105°C | | 1000 | cycles |

(1) This programming time includes overhead of state machine, but does not include data transfer time. The programming time assumes programming 288 bits at a time at the maximum specified operating frequency.

6.10.5.2 Flash Program and Erase Timings for Data Flash

Table 6-32. Timing Requirements for Data Flash

| | | MIN | NOM | MAX | UNIT |
|---|---|----------------------------------|-----|--------|---------------|
| $t_{\text{prog}(72\text{bits})}$ | Wide Word (72-bits) programming time | | 47 | 300 | μs |
| $t_{\text{prog}(\text{Total})}$ | EEPROM Emulation (bank 7) 128KB programming time ⁽¹⁾ | –40°C to 105°C | | 2.6 | s |
| | | 0°C to 60°C, for first 25 cycles | 775 | 1320 | ms |
| EEPROM Emulation (bank 7) Sector/Bank erase time $t_{\text{erase}(\text{bank}7)}$ | | –40°C to 105°C | 0.2 | 8 | s |
| | | 0°C to 60°C, for first 25 cycles | 14 | 100 | ms |
| t_{wec} | Write/erase cycles with 15-year Data Retention requirement | –40°C to 105°C | | 100000 | cycles |

(1) This programming time includes overhead of state machine, but does not include data transfer time. The programming time assumes programming 72 bits at a time at the maximum specified operating frequency.

6.11 L2RAMW (Level 2 RAM Interface Module)

L2RAMW is the TMS570 level two RAM wrapper. Major features implemented in this device include:

- Supports 512KB of L2 SRAMs
- One 64-bit OCP interface
- Built-in ECC generation and evaluation logic
 - The ECC logic is enabled by default.
 - When enabled, automatic ECC correction on write data from masters on any write sizes (8-,16-,32-,or 64-bit)
 - Less than 64-bit write forces built in read-modify-write
 - When enabled, reads due to read-modify-write go through ECC correction before data merging with the incoming write data
- Redundant address decoding. Same address decode logic block is duplicated and compared to each other
- Data Trace
 - Support tracing of both read and write accesses through RTP module
- Auto initialization of memory banks to known values for both data and their corresponding ECC checksum

6.11.1 L2 SRAM Initialization

The entire L2 SRAM can be globally initialized by setting the corresponding bit in SYS.MSINENA register. When initialized, the memory arrays are written with all zeros for the 64-bit data and the corresponding 8-bit ECC checksum. Hardware memory initialization eliminates ECC error when the CPU reads from an uninitialized memory location which can cause an ECC error. For more information, see the device-specific Technical Reference Manual.

6.12 ECC / Parity Protection for Accesses to Peripheral RAMs

Accesses to some peripheral RAMs are protected by either odd/even parity checking or ECC checking. During a read access the parity or ECC is calculated based on the data read from the peripheral RAM and compared with the good parity or ECC value stored in the peripheral RAM for that peripheral. If any word fails the parity or ECC check, the module generates a ECC/parity error signal that is mapped to the Error Signaling Module. The module also captures the peripheral RAM address that caused the parity error.

The parity or ECC protection for peripheral RAMs is not enabled by default and must be enabled by the application. Each individual peripheral contains control registers to enable the parity or ECC protection for accesses to its RAM.

NOTE

For peripherals with parity protection the CPU read access gets the actual data from the peripheral. The application can choose to generate an interrupt whenever a peripheral RAM parity error is detected.

6.13 On-Chip SRAM Initialization and Testing

6.13.1 On-Chip SRAM Self-Test Using PBIST

6.13.1.1 Features

- Extensive instruction set to support various memory test algorithms
- ROM-based algorithms allow application to run TI production-level memory tests
- Independent testing of all on-chip SRAM

6.13.1.2 PBIST RAM Groups

Table 6-33. PBIST RAM Grouping

| MEMORY | RAM GROUP | TEST CLOCK | RGS | RDS | MEM TYPE | NO. BANKS | TEST PATTERN (ALGORITHM) | | | |
|---------------------|-----------|---------------|-----|-------|----------|-----------|--------------------------|-----------------------|--|---|
| | | | | | | | TRIPLE READ SLOW READ | TRIPLE READ FAST READ | March 13N ⁽¹⁾ TWO PORT (cycles) | March 13N ⁽¹⁾ SINGLE PORT (cycles) |

(1) March13N is the only algorithm recommended for application testing of RAM.

(2) ATB RAM is part of the ETM module. PBIST testing of this RAM is limited to 85°C or lower and 300MHz or slower.

Table 6-33. PBIST RAM Grouping (continued)

Several memory testing algorithms are stored in the PBIST ROM. However, TI only recommends the March13N algorithm for application testing of RAM.

The PBIST ROM clock frequency is limited to the maximum frequency of 82.5 MHz.

The PBIST ROM clock is divided down from HCLK. The divider is selected by programming the ROM_DIV field of the Memory Self-Test Global Control Register (MSTGCR) at address 0xFFFFF58.

6.13.2 On-Chip SRAM Auto Initialization

This microcontroller allows some of the on-chip memories to be initialized through the Memory Hardware Initialization mechanism in the system module. This hardware mechanism allows an application to program the memory arrays with error detection capability to a known state based on their error detection scheme (odd/even parity or ECC).

The MINITGCR register enables the memory initialization sequence, and the MSINENA register selects the memories that are to be initialized.

For more information on these registers, see the device-specific Technical Reference Manual.

The mapping of the different on-chip memories to the specific bits of the MSINENA registers is provided in [Table 6-34](#).

Table 6-34. Memory Initialization⁽¹⁾⁽²⁾

| CONNECTING MODULE | ADDRESS RANGE | | SYS.MSINENA Register Bit # | L2RAMW.MEMINT_ENA Register Bit # ⁽³⁾ |
|----------------------------|---------------|----------------|----------------------------|---|
| | BASE ADDRESS | ENDING ADDRESS | | |
| L2 SRAM | 0x08000000 | 0x0800FFFF | 0 | 0 |

| VIM RAM | 0xFFF82000 | 0xFFF82FFF | 2 | n/a |

- (1) If parity protection is enabled for the peripheral SRAM modules, then the parity bits will also be initialized along with the SRAM modules.
- (2) If ECC protection is enabled for the CPU data RAM or peripheral SRAM modules, then the auto-initialization process also initializes the corresponding ECC space.
- (3) The L2 SRAM from range 128KB to 512KB is divided into 8 memory regions. Each region has an associated control bit to enable auto-initialization.
- (4) The MibSPIx modules perform an initialization of the transmit and receive RAMs as soon as the multibuffered mode is enabled. This is independent of whether the application has already initialized these RAMs using the auto-initialization method or not. The MibSPIx modules must be released from reset by writing a 1 to the SPIGCR0 registers before starting auto-initialization on the respective RAMs.

NOTE

Peripheral memories not listed in the table either do not support auto-initialization or have implemented auto-initialization controlled directly by their respective peripherals.

6.14 External Memory Interface (EMIF)

6.14.1 Features

The EMIF includes many features to enhance the ease and flexibility of connecting to external asynchronous memories or SDRAM devices. The EMIF features includes support for:

- 3 addressable chip select for asynchronous memories of up to 16MB each
- 1 addressable chip select space for SDRAMs up to 128MB
- 8 or 16-bit data bus width
- Programmable cycle timings such as setup, strobe, and hold times as well as turnaround time
- Select strobe mode
- Extended Wait mode
- Data bus parking

NOTE

For a 32-bit access on the 16-bit EMIF interface, the lower 16-bits (the EMIF_BA[1] will be low) will be put out first followed by the upper 16-bits (EMIF_BA[1] will be high).

6.14.2 Electrical and Timing Specifications

6.14.2.1 Read Timing (Asynchronous RAM)

Figure 6-11. Asynchronous Memory Read Timing

Figure 6-12. EMIFnWAIT Read Timing Requirements

6.14.2.2 Write Timing (Asynchronous RAM)

Figure 6-13. Asynchronous Memory Write Timing

Figure 6-14. EMIFnWAIT Write Timing Requirements

6.14.2.3 EMIF Asynchronous Memory Timing

Table 6-35. EMIF Asynchronous Memory Timing Requirements⁽¹⁾

| NO. | | | MIN | NOM | MAX | UNIT |
|-------------------------|------------------------|--|-------|-----|-----|------|
| Reads and Writes | | | | | | |
| 2 | $t_{w(EM_WAIT)}$ | Pulse duration, EMIFnWAIT assertion and deassertion | 2E | | | ns |
| Reads | | | | | | |
| 12 | $t_{su(EMDV-EMOEH)}$ | Setup time, EMIFDATA[15:0] valid before EMIFnOE high | 11 | | | ns |
| 13 | $t_{h(EMOEH-EMDIV)}$ | Hold time, EMIFDATA[15:0] valid after EMIFnOE high | 0.5 | | | ns |
| 14 | $t_{su(EMOEL-EMWAIT)}$ | Setup Time, EMIFnWAIT asserted before end of Strobe Phase ⁽²⁾ | 4E+14 | | | ns |
| Writes | | | | | | |
| 28 | $t_{su(EMWEL-EMWAIT)}$ | Setup Time, EMIFnWAIT asserted before end of Strobe Phase ⁽²⁾ | 4E+14 | | | ns |

- (1) E = EMIF_CLK period in ns.
- (2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EMIFnWAIT must be asserted to add extended wait states. Figure 6-12 and Figure 6-14 describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 6-36. EMIF Asynchronous Memory Switching Characteristics⁽¹⁾⁽²⁾⁽³⁾

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
|-------------------------|-------------------|-------------------------------|-----------------------|-------------------|-----------------------|------|
| Reads and Writes | | | | | | |
| 1 | $t_d(TURNAROUND)$ | Turn around time | (TA)*E - 3 | (TA)*E | (TA)*E + 3 | ns |
| Reads | | | | | | |
| 3 | $t_c(EMRCYCLE)$ | EMIF read cycle time (EW = 0) | (RS+RST+RH)*E-3 | (RS+RST+RH)*E | (RS+RST+RH)*E + 3 | ns |
| | | EMIF read cycle time (EW = 1) | (RS+RST+RH+EWC)*E - 3 | (RS+RST+RH+EWC)*E | (RS+RST+RH+EWC)*E + 3 | ns |

- (1) TA = Turn around, RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold, MEWC = Maximum external wait cycles. These parameters are programmed through the Asynchronous Bank and Asynchronous Wait Cycle Configuration Registers. These support the following ranges of values: TA[4–1], RS[16–1], RST[64–1], RH[8–1], WS[16–1], WST[64–1], WH[8–1], and MEWC[1–256]. See the EMIF chapter of the TRM SPNU562 for more information.
- (2) E = EMIF_CLK period in ns.
- (3) EWC = external wait cycles determined by EMIFnWAIT input signal. EWC supports the following range of values. EWC[256–1]. Note that the maximum wait time before time-out is specified by bit field MEWC in the Asynchronous Wait Cycle Configuration Register. See the EMIF chapter of the TRM SPNU562 for more information.

Table 6-36. EMIF Asynchronous Memory Switching Characteristics⁽¹⁾⁽²⁾⁽³⁾ (continued)

6.15 Vectored Interrupt Manager

There are two on-chip Vector Interrupt Manager (VIM) modules. The VIM module provides hardware assistance for prioritizing and controlling the many interrupt sources present on a device. Interrupts are caused by events outside of the normal flow of program execution. Normally, these events require a timely response from the CPU; therefore, when an interrupt occurs, the CPU switches execution from the normal program flow to an interrupt service routine (ISR).

6.15.1 VIM Features

The VIM module has the following features:

- Supports 128 interrupt channels
- Provides programmable priority for the request lines
- Manages interrupt channels through masking
- Prioritizes interrupt channels to the CPU
- Provides the CPU with the address of the interrupt service routine (ISR) for each interrupt

The two VIM modules are in lockstep. These two VIM modules are memory mapped to the same address space. From a programmer's model point of view it is only one VIM module. Writes to VIM1 registers and memory will be broadcasted to both VIM1 and VIM2. Reads from VIM1 will only read the VIM1 registers and memory. All interrupt requests which go to the VIM1 module will also go to the VIM2 module. Because the VIM1 and VIM2 have the identical setup, both will result in the same output behavior responding to the same interrupt requests. The second VIM module acts as a diagnostic checker module against the first VIM module. The output signals of the two VIM modules are routed to CCM-R5F module and are compared constantly. Mis-compare detected will be signaled as an error to the ESM module. The lockstep VIM pair takes care of the interrupt generation to the lockstep R5F pair.

6.15.2 Interrupt Generation

To avoid common mode failures the input and output signals of the two VIMs are delayed in a different way as shown in Figure 6-17.

Figure 6-17. Interrupt Generation

6.15.3 Interrupt Request Assignments

Table 6-39. Interrupt Request Assignments

| MODULES | VIM INTERRUPT SOURCES | DEFAULT VIM INTERRUPT CHANNEL |
|----------|---|-------------------------------|
| ESM | ESM high-level interrupt (NMI) | 0 |
| Reserved | Reserved | 1 |

| CRC2 | CRC2 Interrupt | 121 |
| Reserved | Reserved | 122 |
| Reserved | Reserved | 123 |
| EPC | EPC FIFO FULL or CAM FULL interrupt | 124 |
| Reserved | Reserved | 125-127 |

NOTE

Address location 0x00000000 in the VIM RAM is reserved for the phantom interrupt ISR entry; therefore only request channels 0..126 can be used and are offset by one address in the VIM RAM.

NOTE

The EMIF_nWAIT signal has a pull-up on it. The EMIF module generates a "Wait Rise" interrupt whenever it detects a rising edge on the EMIF_nWAIT signal. This interrupt condition is indicated as soon as the device is powered up. This can be ignored if the EMIF_nWAIT signal is not used in the application. If the EMIF_nWAIT signal is actually used in the application, then the external slave memory must always drive the EMIF_nWAIT signal such that an interrupt is not caused due to the default pull-up on this signal.

NOTE

The lower-order interrupt channels are higher priority channels than the higher-order interrupt channels.

NOTE

The application can change the mapping of interrupt sources to the interrupt channels through the interrupt channel control registers (CHANCTRLx) inside the VIM module.

6.16 ECC Error Event Monitoring and Profiling

This device includes an Error Profiling Controller (EPC) module. The main goal of this module is to enable the system to tolerate a certain amount of ECC correctable errors on the same address repeatedly in the memory system with minimal runtime overhead. Main features implemented in this device are described below.

- Capture the address of correctable ECC faults from different sources (for example, CPU, L2RAM, Interconnect) into a 16-entry Content Addressable Memory (CAM).
- For correctable faults, the error handling depends on the below conditions:
 - if the incoming address is already in the 16-entry CAM, discard the fail. No error generated to ESM
 - if the address is not in the CAM list, and the CAM has empty entries, add the address into the CAM list. In addition, raise the error signal to the ESM group 1 if enabled.
 - if the address is not in the CAM list, and the CAM has no empty entries, always raise a signal to the ESM group 1.
- A 4-entry FIFO to store correctable error events and addresses for each IP interface.
- For uncorrectable faults of non-CPU access, capture the address and raise a signal to the ESM group 2.
- The CAM is implemented in memory mapped registers. The CPU can read and write to any entry for diagnostic test as if a real CAM memory macro.

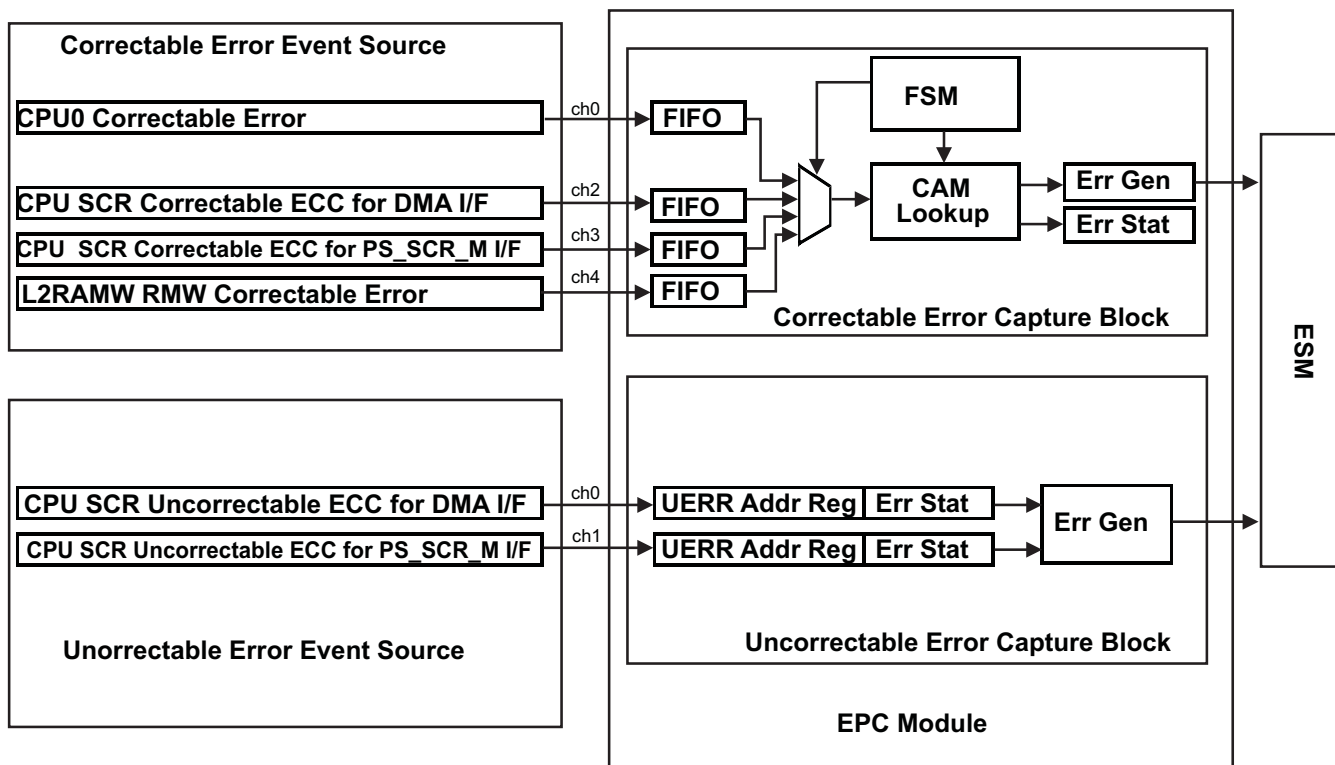

Figure 6-18. EPC Block Diagram

6.16.1 EPC Module Operation

6.16.1.1 Correctable Error Handling

When a correctable error is detected in the system by an IP, it sends the error signal along with the error address to EPC module. The EPC module will scan this error address in the 16-entry CAM. If there is a match then the address is discarded and no error is generated to ESM by the ECP. It takes one cycle to scan one address at a time through the CAM. The idea is to allow the system to tolerate a correctable error occurring on the same address because this error has been handled before by the CPU. This error scenario is particularly frequent when the software is in a for loop fetching the same address. Because there are multiple IPs which can simultaneously detect correctable errors in the system, the EPC employs a 4-entry FIFO per IP interface so that error addresses are not lost.

If an address is not matched in the CAM then it depends if there is empty entry in the CAM. If there is an empty entry then the new address is stored into the empty entry. For each entry there is a 4-bit valid key. When a new address is stored the 4-bit key is updated with "1010". It is programmable to generate a correctable error to the ESM if the address is not matched and there is an empty CAM entry. Once CPU is interrupted, it can choose to evaluate the error address and handle it accordingly. The software can also invalidate the entry by writing "0101".

If an address is not matched and there is no empty entry in the CAM then the correctable error is immediately sent to the ESM. The new error address is lost if there is no empty entry left in the CAM.

6.16.1.2 Uncorrectable Error Handling

Uncorrectable errors reported by the IP (non-CPU access) are immediately captured for their error addresses and update to the uncorrectable error status register. For more information see the device specific technical reference guide [SPNU562](#).

6.17 DMA Controller

The DMA controller is used to transfer data between two locations in the memory map in the background of CPU operations. Typically, the DMA is used to:

- Transfer blocks of data between external and internal data memories
- Restructure portions of internal data memory
- Continually service a peripheral

6.17.1 DMA Features

- 64-bit OCP protocol to perform bus master accesses
- INCR-4 64-bit burst accesses
- Multithreading architecture allowing data of two different channel transfers to be interleaved during nonburst accesses
- 2-port configuration for parallel bus master
- Channels can be assigned to either high-priority queue or low-priority queue. Within each queue, fixed or round-robin priorities can be serviced
- Built-in ECC generation and evaluation logic for internal RAM storing channel transfer information
- Supports multiple interrupt outputs for mapping to multiple interrupt controllers in multicore systems
- 48 requests can be mapped to any 32 channels
- Supports LE endianness
- External ECC Gen/Eval block of DMA support ECC generation for data transactions, and parity for address, and control signals (following Cortex-R5F standard)
- 8 MPU regions
- Channel chaining capability
- Hardware and software DMA requests
- 8-, 16-, 32-, or 64-bit transactions supported
- Multiple addressing modes for source/destination (fixed, increment, offset)
- Auto-initiation

6.17.2 DMA Transfer Port Assignment

There are two ports, port A and port B attached to the DMA controller. When configuring a DMA channel for a transfer, the application must also specify the port associated with the transfer source and destination. [Table 6-40](#) lists the mapping between each port and the resources. For example, if a transfer is to be made from the the flash to the SRAM, the application will need configure the desired DMA channel in the PARx register to select port A as the target for both the source and destination. If a transfer is to be made from the SRAM to a peripheral or a peripheral memory, the application will need to configure the desired DMA channel in the PARx register to select port A for read and port B for write. Likewise, if a transfer is from a peripheral to the SRAM then the PARx will be configured to select port B for read and port A for write.

Table 6-40. DMA Port Assignment

| TARGET NAME | ACCESS PORT OF DMA |
|--|--------------------|
| Flash | Port A |
| SRAM | Port A |
| EMIF | Port A |
| Flash OTP/ECC/EEPROM | Port A |
| All other targets (peripherals, peripheral memories) | Port B |

6.17.3 Default DMA Request Map

The DMA module on this microcontroller has 32 channels and up to 48 hardware DMA requests. The module contains DREQASx registers which are used to map the DMA requests to the DMA channels. By default, channel 0 is mapped to request 0, channel 1 to request 1, and so on.

Some DMA requests have multiple sources, see [Table 6-41](#). The application must ensure that only one of these DMA request sources is enabled at any time.

Table 6-41. DMA Request Line Connection

| MODULES | DMA REQUEST SOURCES | DMA REQUEST |
|--|---|-------------|

6.17.4 Using a GIO terminal as a DMA Request Input

Each GIO terminal can also directly be used as DMA request input as listed in Table 6-41. The polarity of the GIO terminal to trigger a DMA request can be selected inside the DMA module. To use the GIO terminal as a DMA request input, the corresponding select bit must be set to low. See Figure 6-19 for an illustration. For more information see the technical reference guide SPNU562.

6.18 Real-Time Interrupt Module

The real-time interrupt (RTI) module provides timer functionality for operating systems and for benchmarking code. The RTI module can incorporate several counters that define the time bases needed for scheduling an operating system.

The timers also let you benchmark certain areas of code by reading the values of the counters at the beginning and the end of the desired code range and calculating the difference between the values.

6.18.1 Features

The RTI module has the following features:

- Two independent 64-bit counter blocks
- Four configurable compares for generating operating system ticks or DMA requests. Each event can be driven by either counter block 0 or counter block 1.
- Fast enabling/disabling of events
- Two timestamp (capture) functions for system or peripheral interrupts, one for each counter block

6.18.2 Block Diagrams

Figure 6-20 shows a high-level block diagram for one of the two 64-bit counter blocks inside the RTI module. Both the counter blocks are identical except the Network Time Unit (NTUx) inputs are only available as time-base inputs for the counter block 0. Figure 6-21 shows the compare unit block diagram of the RTI module.

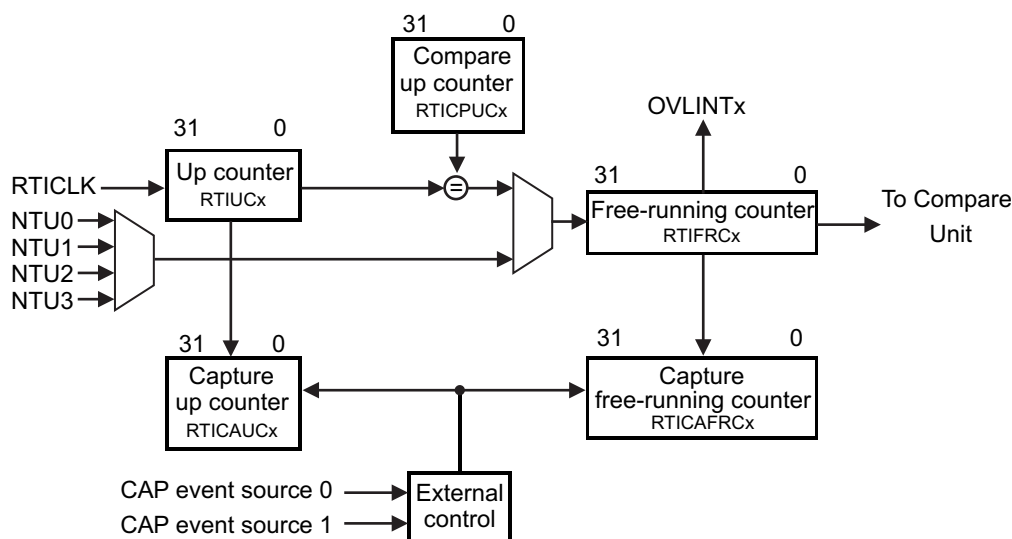

Figure 6-20. Counter Block Diagram

Figure 6-21. Compare Block Diagram

6.18.3 Clock Source Options

The RTI module uses the RTI1CLK clock domain for generating the RTI time bases.

The application can select the clock source for the RTI1CLK by configuring the RCLKSRC register in the system module at address 0xFFFFF50. The default source for RTI1CLK is VCLK.

For more information on clock sources, see [Table 6-11](#) and [Table 6-16](#).

6.18.4 Network Time Synchronization Inputs

The RTI module supports four Network Time Unit (NTU) inputs that signal internal system events, and which can be used to synchronize the time base used by the RTI module. On this device, these NTU inputs are connected as shown in [Table 6-43](#).

Table 6-43. Network Time Synchronization Inputs

| NTU INPUT | SOURCE |
|-----------|-----------------------|
| 0 | Reserved |
| 1 | Reserved |
| 2 | PLL2 Clock output |
| 3 | EXTCLKIN1 clock input |

6.19 Error Signaling Module

The Error Signaling Module (ESM) manages the various error conditions on the TMS570LCx microcontroller. The error condition is handled based on a fixed severity level assigned to it. Any severe error condition can be configured to drive a low level on a dedicated device terminal called nERROR. The nERROR can be used as an indicator to an external monitor circuit to put the system into a safe state.

6.19.1 ESM Features

The features of the ESM are:

- 160 interrupt/error channels are supported, divided into three groups
 - 96 channels with maskable interrupt and configurable error terminal behavior
 - 32 error channels with nonmaskable interrupt and predefined error terminal behavior
 - 32 channels with predefined error terminal behavior only
- Error terminal to signal severe device failure
- Configurable time base for error signal
- Error forcing capability

6.19.2 ESM Channel Assignments

The ESM integrates all the device error conditions and groups them in the order of severity. Group1 is used for errors of the lowest severity while Group3 is used for errors of the highest severity. The device response to each error is determined by the severity group to which the error is connected. [Table 6-45](#) lists the channel assignment for each group.

Table 6-44. ESM Groups

| ERROR GROUP | INTERRUPT CHARACTERISTICS | INFLUENCE ON ERROR TERMINAL |
|-------------|--------------------------------|-----------------------------|
| Group1 | Maskable, low or high priority | Configurable |
| Group2 | Nonmaskable, high priority | Fixed |
| Group3 | No interrupt generated | Fixed |

(2) Oscillator fail/PLL slip can be configured in the system register (SYS.PLLCTL1) to generate a reset.

6.21 Digital Windowed Watchdog

This device includes a Digital Windowed Watchdog (DWWD) module that protects against runaway code execution (see [Figure 6-22](#)).

The DWWD module allows the application to configure the time window within which the DWWD module expects the application to service the watchdog. A watchdog violation occurs if the application services the watchdog outside of this window, or fails to service the watchdog at all. The application can choose to generate a system reset or a nonmaskable interrupt to the CPU in case of a watchdog violation.

The watchdog is disabled by default and must be enabled by the application. Once enabled, the watchdog can only be disabled upon a system reset.

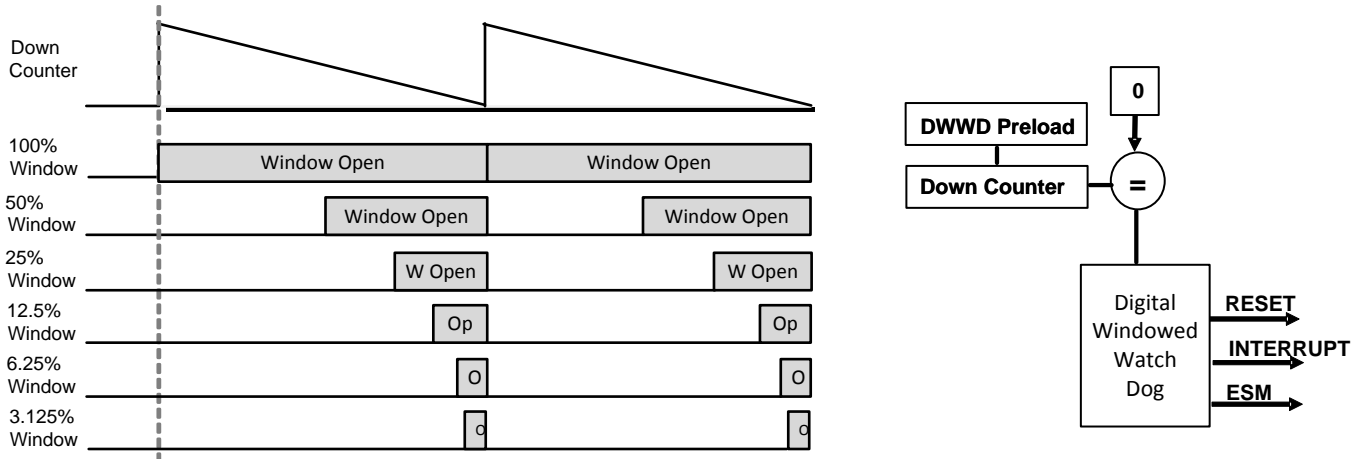

Figure 6-22. Digital Windowed Watchdog Example

6.22 Debug Subsystem

6.22.1 Block Diagram

The device contains an ICEPICK module (version C) to allow JTAG access to the scan chains (see Figure 6-23).

Figure 6-23. Debug Subsystem Block Diagram

6.2.2.2 Debug Components Memory Map

Table 6-47. Debug Components Memory Map

| MODULE NAME | FRAME CHIP SELECT | FRAME ADDRESS RANGE | | FRAME SIZE | ACTUAL SIZE | RESPONSE FOR ACCESS TO UNIMPLEMENTED LOCATIONS IN FRAME |
|---------------------|-------------------|---------------------|-------------|------------|-------------|---|
| | | START | END | | | |

6.2.2.3 Embedded Cross Trigger

The Embedded Cross Trigger (ECT) is a modular component that supports the interaction and synchronization of multiple triggering events within a SoC.

The ECT consists of two modules:

- A (Cross Trigger Interface) CTI. The CTI provides the interface between a component or subsystem and the Cross Trigger Matrix (CTM).
- A CTM. The CTM combines the trigger requests generated from CTIs and broadcasts them to all CTIs as channel triggers. This enables subsystems to interact, cross trigger, with one another.

Figure 6-24. CTI/CTM Integration

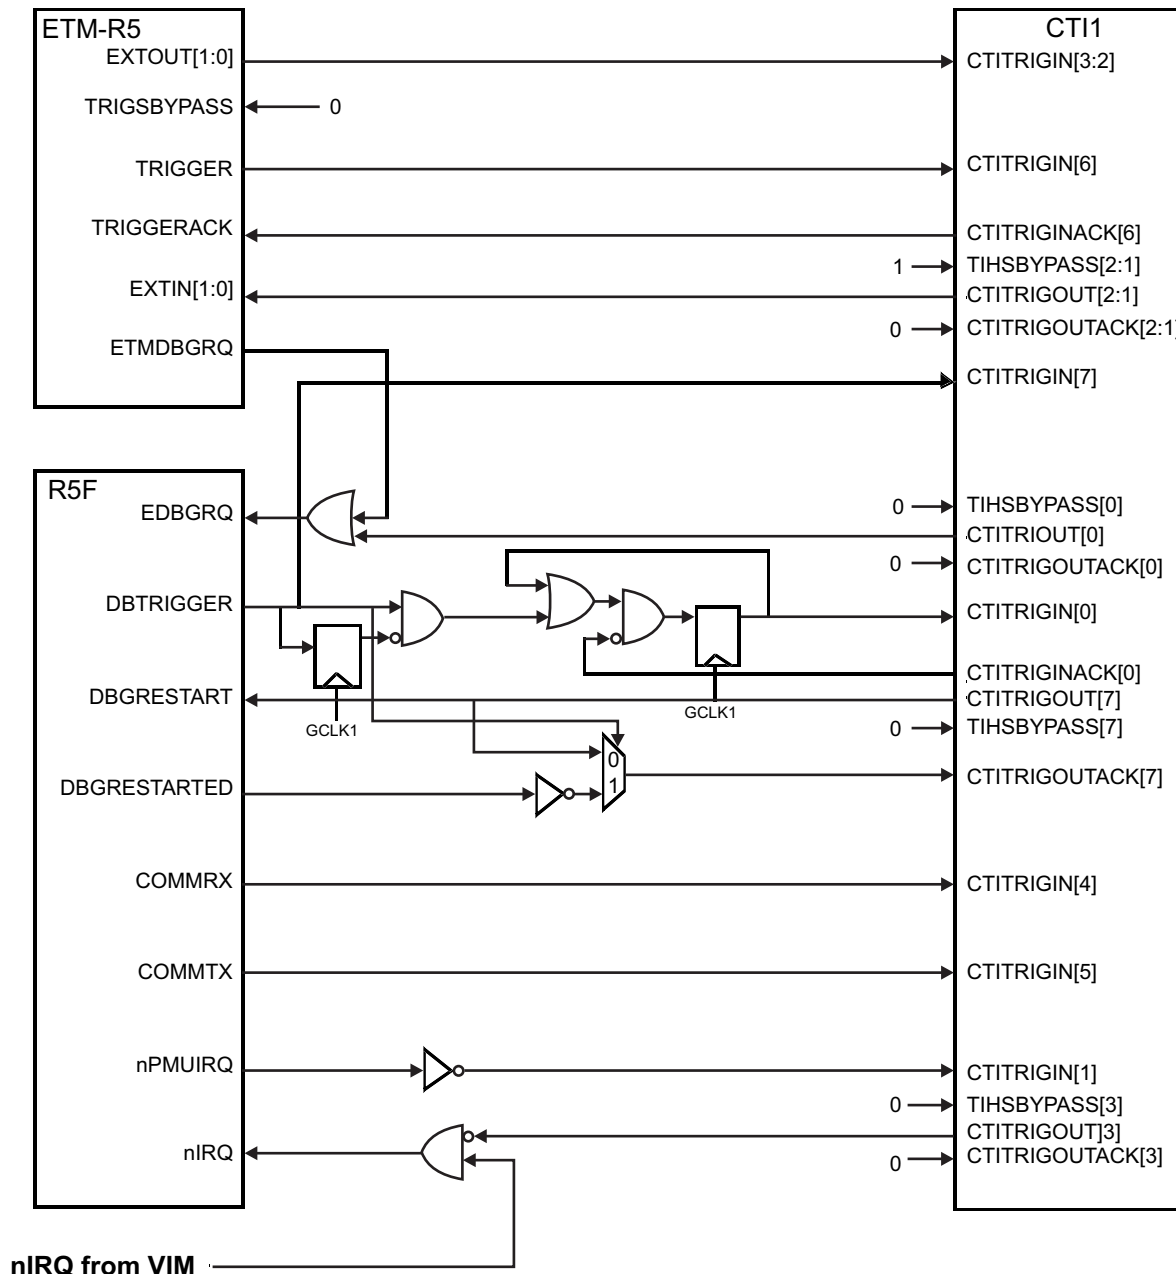

Figure 6-25. CT11 Mapping

NOTE

ETM-R5, Cortex-R5F and CTI1 run at same frequency.

Table 6-48. CTI1 Mapping

| CTI TRIGGER | Module Signal |
|--------------------|----------------------------|
| Trigger Input 0 | From Cortex-R5F DBTRIGGER |
| Trigger Input 1 | From Cortex-R5F nPMUIRQ |
| Trigger Input 2 | From ETM-R5 EXTOUT[0] |
| Trigger Input 3 | From ETM-R5 EXTOUT[1] |
| Trigger Input 4 | From Cortex-R5F COMMRX |
| Trigger Input 5 | From Cortex-R5F COMMTX |
| Trigger Input 6 | From ETM-R5 TRIGGER |
| Trigger Input 7 | From Cortex-R5F DBTRIGGER |
| Trigger Output 0 | To Cortex-R5F EDBGRRQ |

6.22.6 JTAG Scan Interface Timings

Table 6-54. JTAG Scan Interface Timing⁽¹⁾

| NO. | PARAMETER | MIN | MAX | UNIT | |
|-----|----------------------|---|-----|------|-----|
| | fTCK | TCK frequency (at HCLKmax) | | 12 | MHz |
| | fRTCK | RTCK frequency (at TCKmax and HCLKmax) | | 10 | MHz |
| 1 | td(TCK - RTCK) | Delay time, TCK to RTCK | | 24 | ns |
| 2 | tsu(TDI/TMS - RTCKr) | Setup time, TDI, TMS before RTCK rise (RTCKr) | | 26 | ns |
| 3 | th(RTCKr - TDI/TMS) | Hold time, TDI, TMS after RTCKr | | 0 | ns |
| 4 | th(RTCKr - TDO) | Hold time, TDO after RTCKr | | 0 | ns |
| 5 | td(TCKf - TDO) | Delay time, TDO valid after RTCK fall (RTCKf) | | 12 | ns |

(1) Timings for TDO are specified for a maximum of 50-pF load on TDO.

Figure 6-28. JTAG Timing

6.22.7 Advanced JTAG Security Module

This device includes a an Advanced JTAG Security Module (AJSM) module. The AJSM provides maximum security to the memory content of the device by letting users secure the device after programming.

Figure 6-29. AJSM Unlock

The device is unsecure by default by virtue of a 128-bit visible unlock code programmed in the OTP address 0xF0000000. The OTP contents are XOR-ed with the contents of the "Unlock By Scan" register. The outputs of these XOR gates are again combined with a set of secret internal tie-offs. The output of this combinational logic is compared against a secret hard-wired 128-bit value. A match results in the UNLOCK signal being asserted, so that the device is now unsecure.

A user can secure the device by changing at least 1 bit in the visible unlock code from 1 to 0. Changing a 0 to 1 is not possible because the visible unlock code is stored in the One Time Programmable (OTP) flash region. Also, changing all 128 bits to zeros is not a valid condition and will permanently secure the device.

Once secured, a user can unsecure the device by scanning an appropriate value into the "Unlock By Scan" register of the AJSM. The value to be scanned is such that the XOR of the OTP contents and the Unlock-By-Scan register contents results in the original visible unlock code.

The Unlock-By-Scan register is reset only upon asserting power-on reset (nPORRST).

A secure device only permits JTAG accesses to the AJSM scan chain through the Secondary Tap 2 of the ICEPick module. All other secondary taps, test taps, and the boundary scan interface are not accessible in this state.

6.22.8 Embedded Trace Macrocell (ETM-R5)

The device contains a ETM-R5 module with a 32-bit internal data port. The ETM-R5 module is connected to a Trace Port Interface Unit (TPIU) with a 32-bit data bus. The TPIU provides a 35-bit (32-bit data, 3-bit control) external interface for trace. The ETM-R5 is CoreSight compliant and follows the ETM v3 specification. For more details, see the ARM CoreSight ETM-R5 TRM specification.

6.22.8.1 ETM TRACECLKIN Selection

The ETM clock source can be selected as either VCLK or the external ETMTRACECLKIN terminal. The selection is chosen by the EXTCTLOUT[1:0] control bits of the TPIU (default is '00'). The address of this register is the TPIU base address + 0x404.

Before the user begins accessing TPIU registers, the TPIU should be unlocked through the CoreSight key and 1 or 2 written to this register.

Table 6-55. TPIU / TRACECLKIN Selection

| EXTCTLOUT[1:0] | TPIU/TRACECLKIN |
|----------------|-----------------|
| 00 | Tied-zero |
| 01 | VCLK |
| 10 | ETMTRACECLKIN |
| 11 | Tied-zero |

6.22.8.2 Timing Specifications

Figure 6-30. ETMTRACECLKOUT Timing

Table 6-56. ETMTRACECLK Timing

| PARAMETER | | MIN | MAX | UNIT |
|----------------|--------------------------|-------|-----|------|
| $t_{cyc(ETM)}$ | Clock period | 18.18 | | ns |
| $t_l(ETM)$ | Low pulse width | 6 | | ns |
| $t_h(ETM)$ | High pulse width | 6 | | ns |
| $t_r(ETM)$ | Clock and data rise time | | 3 | ns |
| $t_f(ETM)$ | Clock and data fall time | | 3 | ns |

Figure 6-31. ETMDATA Timing

Table 6-57. ETMDATA Timing

| PARAMETER | | MIN | MAX | UNIT |
|---------------|-----------------|-----|-----|------|
| $t_{su(ETM)}$ | Data setup time | 2.5 | | ns |
| $t_{h(ETM)}$ | Data hold time | 1.5 | | ns |

NOTE

The ETMTRACECLK and ETMDATA timing is based on a 15-pF load and for ambient temperatures lower than 85°C.

6.22.9 RAM Trace Port (RTP)

The RTP provides the ability to datalog the RAM contents of the RM57Dx devices or accesses to peripherals without program intrusion. It can trace all data write or read accesses to internal RAM. In addition, it provides the capability to directly transfer data to a FIFO to support a CPU-controlled transmission of the data. The trace data is transmitted over a dedicated external interface.

6.22.9.1 RTP Features

The RTP offers the following features:

- Two modes of operation - Trace Mode and Direct Data Mode
 - Trace Mode
 - Nonintrusive data trace on write or read operation
 - Visibility of RAM content at any time on external capture hardware
 - Trace of peripheral accesses
 - 2 configurable trace regions for each RAM module to limit amount of data to be traced
 - FIFO to store data and address of data of multiple read/write operations
 - Trace of CPU and/or DMA accesses with indication of the master in the transmitted data packet
 - Direct Data Mode
 - Directly write data with the CPU or trace read operations to a FIFO, without transmitting header and address information
- Dedicated synchronous interface to transmit data to external devices
- Free-running clock generation or clock stop mode between transmissions
- Up to 100 Mbps terminal transfer rate for transmitting data
- Pins not used in functional mode can be used as GIOs

6.22.9.2 Timing Specifications

Figure 6-32. RTPCLK Timing

Table 6-58. RTPCLK Timing

| PARAMETER | | MIN | MIN | UNIT |
|----------------|------------------|--------------------------------------|-----|------|
| $t_{cyc(RTP)}$ | Clock period | 9.09 (= 110 MHz) | | ns |
| $t_{h(RTP)}$ | High pulse width | $((t_{cyc(RTP)})/2) - ((t_r+t_f)/2)$ | | ns |
| $t_{l(RTP)}$ | Low pulse width | $((t_{cyc(RTP)})/2) - ((t_r+t_f)/2)$ | | ns |

Figure 6-33. RTPDATA Timing

Table 6-59. RTPDATA Timing

| PARAMETER | | MIN | MAX | UNIT |
|----------------|-----------------|-----|-----|------|
| $t_{dsu(RTP)}$ | Data setup time | 3 | | ns |
| $t_{dh(RTP)}$ | Data hold time | 1 | | ns |
| $t_{ssu(RTP)}$ | SYNC setup time | 3 | | ns |
| $t_{sh(RTP)}$ | SYNC hold time | 1 | | ns |

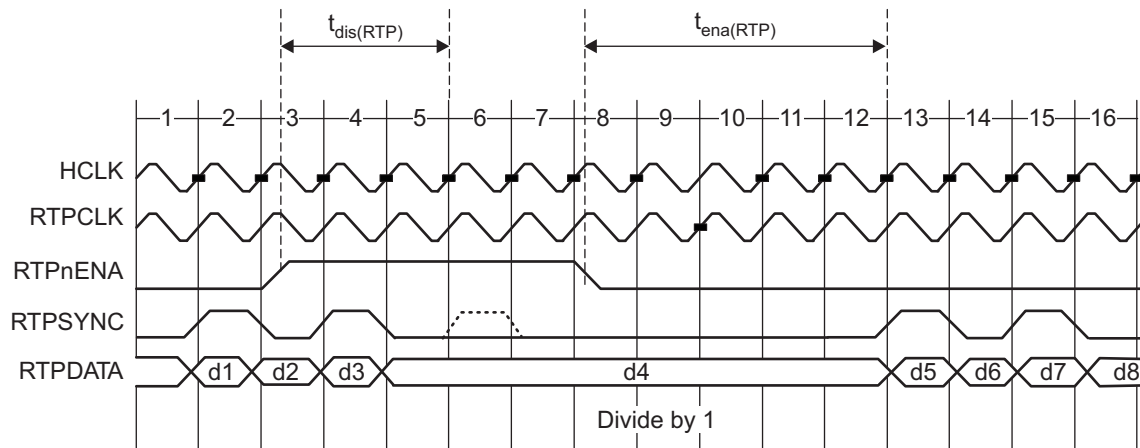

Figure 6-34. RTPnENA timing

Table 6-60. RTPnENA timing

| PARAMETER | | MIN | MAX | UNIT |
|----------------|---|--------------------------------------|--------------------------------------|------|
| $t_{dis(RTP)}$ | Disable time, time RTPnENA must go high before what would be the next RTPSYNC, to ensure delaying the next packet | $3t_{c(HCLK)} + t_{r(RTPSYNC)} + 12$ | | ns |
| $t_{ena(RTP)}$ | Enable time, time after RTPnENA goes low before a packet that has been halted, resumes | $4t_{c(HCLK)} + t_{r(RTPSYNC)}$ | $5t_{c(HCLK)} + t_{r(RTPSYNC)} + 12$ | ns |

6.22.10 Data Modification Module (DMM)

The Data Modification Module (DMM) provides the capability to modify data in the entire 4GB address space of the RM57Dx devices from an external peripheral, with minimal interruption of the application.

6.22.10.1 DMM Features

The DMM module has the following features:

- Acts as a bus master, enabling direct writes to the 4GB address space without CPU intervention
- Writes to memory locations specified in the received packet (leverages packets defined by trace mode of the RAM Trace Port (RTP) module)
- Writes received data to consecutive addresses, which are specified by the DMM module (leverages packets defined by direct data mode of the RTP module)
- Configurable port width (1-, 2-, 4-, 8-, 16-pins)
- Up to 100 Mbps terminal data rate
- Unused pins configurable as GIO pins

6.22.10.2 Timing Specifications

Table 6-61. DMMCLK Timing (see Figure 6-35)

| PARAMETER | | MIN | MAX | UNIT |
|----------------|---------------------------------|--------------------------------------|-----|------|
| $t_{cyc(DMM)}$ | Cycle time, DMMCLK clock period | 9.09 | | ns |
| $t_{h(DMM)}$ | High-pulse width | $((t_{cyc(DMM)})/2) - ((t_r+t_f)/2)$ | | ns |
| $t_{l(DMM)}$ | Low-pulse width | $((t_{cyc(DMM)})/2) - ((t_r+t_f)/2)$ | | ns |

Figure 6-35. DMMCLK Timing

Table 6-62. DMMDATA Timing (see Figure 6-36)

| PARAMETER | | MIN | MAX | UNIT |
|----------------|--|-----|-----|------|
| $t_{ssu(DMM)}$ | Setup time, SYNC active before clk falling edge | 2 | | ns |
| $t_{sh(DMM)}$ | Hold time, clk falling edge after SYNC deactive | 3 | | ns |
| $t_{dsu(DMM)}$ | Setup time, DATA before clk falling edge | 2 | | ns |
| $t_{dh(DMM)}$ | Hold time, clk falling edge after DATA hold time | 3 | | ns |

Figure 6-36. DMMDATA Timing

Figure 6-37 shows a case with 1 DMM packet per 2 DMMCLK cycles (Mode = Direct Data Mode, data width = 8, portwidth = 4) where none of the packets received by the DMM are sent out, leading to filling up of the internal buffers. The DMMnENA signal is shown asserted, after the first two packets have been received and synchronized to the HCLK domain. Here, the DMM has the capacity to accept packets D4x, D5x, D6x, D7x. Packet D8 would result in an overflow. Once DMMnENA is asserted, the DMM expects to stop receiving packets after 4 HCLK cycles; once DMMnENA is deasserted, the DMM can handle packets immediately (after 0 HCLK cycles).

Figure 6-37. DMMnENA Timing

6.22.11 Boundary Scan Chain

The device supports BSDL-compliant boundary scan for testing pin-to-pin compatibility. The boundary scan chain is connected to the Boundary Scan Interface of the ICEPICK module (see [Figure 6-38](#)).

Figure 6-38. Boundary Scan Implementation (Conceptual Diagram)

Data is serially shifted into all boundary-scan buffers through TDI, and out through TDO.

7 Peripheral Information and Electrical Specifications

7.1 Enhanced Translator PWM Modules (ePWM)

Figure 7-1 shows the connections between the seven ePWM modules (ePWM1–ePWM7) on the device.

A. For more detail on the ePWMx input synchronization selection, see Figure 7-2.

Figure 7-1. ePWMx Module Interconnections

Figure 7-2 shows the detailed input synchronization selection (asynchronous, double-synchronous, or double synchronous + filter width) for ePWMx.

Figure 7-2. ePWMx Input Synchronization Selection Detail

7.1.1 ePWM Clocking and Reset

Each ePWM module has a clock enable (ePWMxENCLK) which is controlled by its respective Peripheral Power Down bit in the PSPWRDWNCLR_x register of the PCR2 module. To properly reset the peripherals, the peripherals must be released from reset by setting the PENA bit of the CLKCNTL register in the system module. In addition, the peripherals must be released from their power down state by clearing their respective bit in the PSPWRDWNCLR_x register. By default after reset, the peripherals are in powerdown state.

Table 7-1. ePWMx Clock Enable Control

| ePWM MODULE INSTANCE | CONTROL REGISTER TO ENABLE CLOCK | DEFAULT VALUE |
|----------------------|----------------------------------|---------------|
| ePWM1 | PSPWRDWNCLR3[16] | 1 |
| ePWM2 | PSPWRDWNCLR3[17] | 1 |
| ePWM3 | PSPWRDWNCLR3[18] | 1 |
| ePWM4 | PSPWRDWNCLR3[19] | 1 |
| ePWM5 | PSPWRDWNCLR3[12] | 1 |
| ePWM6 | PSPWRDWNCLR3[13] | 1 |
| ePWM7 | PSPWRDWNCLR3[14] | 1 |

7.1.2 Synchronization of ePWMx Time-Base Counters

A time-base synchronization scheme connects all of the ePWM modules on a device. Each ePWM module has a synchronization input (EPWMxSYNCI) and a synchronization output (EPWMxSYNCO). The input synchronization for the first instance (ePWM1) comes from an external pin. Figure 7-1 shows the synchronization connections for all the ePWMx modules. Each ePWM module can be configured to use or ignore the synchronization input. For more information, see the ePWM module chapter of the device-specific TRM.

7.1.3 Synchronizing all ePWM Modules to the N2HET1 Module Time Base

The connection between the N2HET1_LOOP_SYNC and the SYNCI input of ePWM1 module is implemented as shown in Figure 7-3.

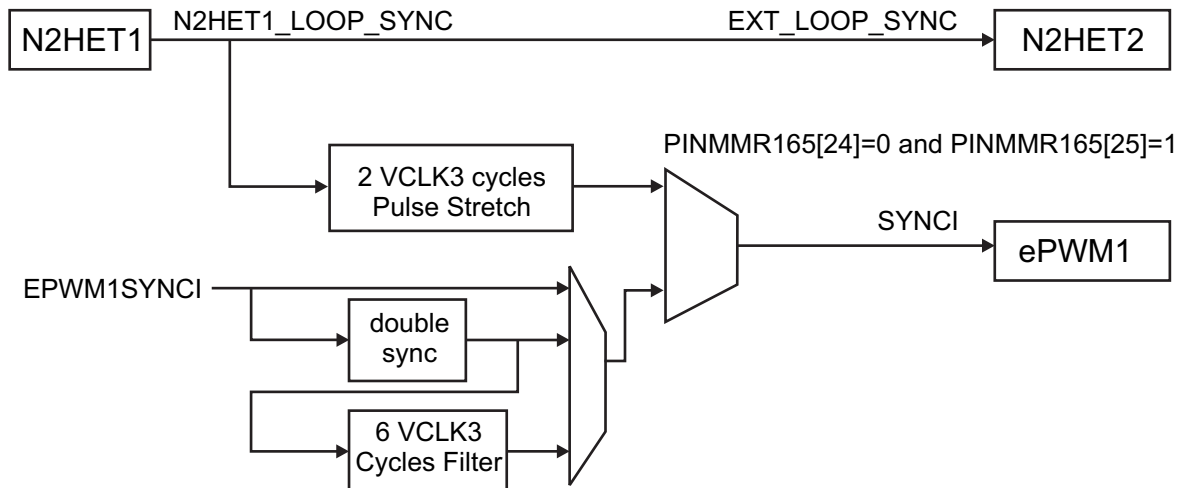

Figure 7-3. Synchronizing Time Bases Between N2HET1, N2HET2 and ePWMx Modules

7.1.4 Phase-Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. This bit is implemented as PINMMR166[1] register bit 1.

When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped. This is the default condition.

When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned.

For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

- Each ePWM is individually associated with a power down bit in the PSPWRDWNCLR_x register of the PCR2 module. Enable the individual ePWM module clocks (if disable) using the control registers in the PCR2.
- Configure TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
- Configure the prescaler values and desired ePWM modes.
- Configure TBCLKSYNC = 1.

7.1.5 ePWM Synchronization with External Devices

The output sync from the ePWM1 module is also exported to the I/O Mux such that multiple devices can be synchronized together. The signal pulse must be stretched by 8 VCLK3 cycles before being exported on the IO Mux pin as the ePWMSYNCO signal.

7.1.6 ePWM Trip Zones

The ePWMx modules have 6 trip zone inputs each. These are active-low signals. The application can control the ePWMx module response to each of the trip zone input separately. The timing requirements from the assertion of the trip zone inputs to the actual response are specified in the electrical and timing section of this document.

7.1.6.1 Trip Zones TZ1n, TZ2n, TZ3n

These 3 trip zone inputs are driven by external circuits and are connected to device-level inputs. These signals are either connected asynchronously to the ePWMx trip zone inputs, or double-synchronized with VCLK3, or double-synchronized and then filtered with a 6-cycle VCLK3-based counter before connecting to the ePWMx (see [Figure 7-2](#)). By default, the trip zone inputs are asynchronously connected to the ePWMx modules.

Table 7-2. Connection to ePWMx Modules for Device-Level Trip Zone Inputs

| TRIP ZONE INPUT | CONTROL FOR ASYNCHRONOUS CONNECTION TO ePWMx | CONTROL FOR DOUBLE-SYNCHRONIZED CONNECTION TO ePWMx | CONTROL FOR DOUBLE-SYNCHRONIZED AND FILTERED CONNECTION TO ePWMx ⁽¹⁾ |
|-----------------|--|---|---|
| TZ1n | PINMMR172[18:16] = 001 | PINMMR172[18:16] = 010 | PINMMR172[18:16] = 100 |
| TZ2n | PINMMR172[26:24] = 001 | PINMMR172[26:24] = 010 | PINMMR172[26:24] = 100 |
| TZ3n | PINMMR173[2:0] = 001 | PINMMR173[2:0] = 010 | PINMMR173[2:0] = 100 |

(1) The filter width is 6 VCLK3 cycles.

7.1.6.2 Trip Zone TZ4n

This trip zone input is dedicated to eQEPx error indications. There are 2 eQEP modules on this device. Each eQEP module indicates a phase error by driving its EQEPxERR output high. The following control registers allow the application to configure the trip zone input (TZ4n) to each ePWMx module based on the requirements of the application's requirements.

Table 7-3. TZ4n Connections for ePWMx Modules

| ePWMx | CONTROL FOR TZ4n = NOT(EQEP1ERR OR EQEP2ERR) | CONTROL FOR TZ4n = NOT(EQEP1ERR) | CONTROL FOR TZ4n = NOT(EQEP2ERR) |
|-------|--|----------------------------------|----------------------------------|
| ePWM1 | PINMMR167[2:0] = 001 | PINMMR167[2:0] = 010 | PINMMR167[2:0] = 100 |
| ePWM2 | PINMMR167[10:8] = 001 | PINMMR167[10:8] = 010 | PINMMR167[10:8] = 100 |
| ePWM3 | PINMMR167[18:16] = 001 | PINMMR167[18:16] = 010 | PINMMR167[18:16] = 100 |
| ePWM4 | PINMMR167[26:24] = 001 | PINMMR167[26:24] = 010 | PINMMR167[26:24] = 100 |
| ePWM5 | PINMMR168[2:0] = 001 | PINMMR168[2:0] = 010 | PINMMR168[2:0] = 100 |
| ePWM6 | PINMMR168[10:8] = 001 | PINMMR168[10:8] = 010 | PINMMR168[10:8] = 100 |
| ePWM7 | PINMMR168[18:16] = 001 | PINMMR168[18:16] = 010 | PINMMR168[18:16] = 100 |

NOTE

The EQEPxERR signal is an active high signal coming out of EQEPx module. As listed in [Table 7-3](#), the selected combination of the EQEPxERR signals must be inverted before connecting to the TZ4n input of the ePWMx modules.

7.1.6.3 Trip Zone TZ5n

This trip zone input is dedicated to a clock failure on the device. That is, this trip zone input is asserted whenever an oscillator failure or a PLL slip is detected on the device. The application can use this trip zone input for each ePWMx module to prevent the external system from going out of control when the device clocks are not within expected range (system running at limp clock).

The oscillator failure and PLL slip signals used for this trip zone input are taken from the status flags in the system module. These level signals are set until cleared by the application.

7.1.6.4 Trip Zone TZ6n

This trip zone input to the ePWMx modules is dedicated to a debug mode entry of the CPU. If enabled, the user can force the PWM outputs to a known state when the emulator stops the CPU. This prevents the external system from going out of control when the CPU is stopped.

NOTE

There is a signal called DBGACK that the CPU drives when it enters debug mode. This signal must be inverted and used as the Debug Mode Entry signal for the trip zone input.

7.1.7 Triggering of ADC Start of Conversion Using ePWMx SOCA and SOCB Outputs

A special scheme is implemented to select the actual signal used for triggering the start of conversion on the two ADCs on this device. This scheme is defined in [Section 7.4.2.3](#).

7.1.8 Enhanced Translator-Pulse Width Modulator (ePWMx) Electrical Data/Timing

Table 7-4. ePWMx Timing Requirements

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|-----------------|-----------------------------------|-------------------------------|--|-----|--------|
| $t_{w(SYNCIN)}$ | Synchronization input pulse width | Asynchronous | $2 t_{c(VCLK3)}$ | | cycles |
| | | Synchronous | $2 t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | $2 t_{c(VCLK3)} + \text{filter width}^{(1)}$ | | cycles |

(1) The filter width is 6 VCLK3 cycles.

Table 7-5. ePWMx Switching Characteristics

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|------------------|---|-----------------|------------------|-----|--------|
| $t_w(PWM)$ | Pulse duration, ePWMx output high or low | | 33.33 | | ns |
| $t_w(SYNCOUT)$ | Synchronization Output Pulse Width | | $8 t_{c(VCLK3)}$ | | cycles |
| $t_d(PWM)t_{za}$ | Delay time, trip input active to PWM forced high, OR Delay time, trip input active to PWM forced low | No pin load | | 25 | ns |
| $t_d(TZ-PWM)HZ$ | Delay time, trip input active to PWM Hi-Z | | | 20 | ns |

Table 7-6. ePWMx Trip-Zone Timing Requirements

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|-----------|-------------------------------|-------------------------------|--|-----|--------|
| $t_w(TZ)$ | Pulse duration, TZn input low | Asynchronous | $2 * TBePWMx$ | | cycles |
| | | Synchronous | $2 t_{c(VCLK3)}$ | | |
| | | Synchronous with input filter | $2 t_{c(VCLK3)} + \text{filter width}^{(1)}$ | | |

(1) The filter width is 6 VCLK3 cycles.

7.2 Enhanced Capture Modules (eCAP)

Figure 7-4 shows how the eCAP modules are interconnected on this microcontroller.

A. For more detail on the eCAPx input synchronization selection, see Figure 7-5.

Figure 7-4. eCAP Module Connections

Figure 7-5 shows the detailed input synchronization selection (asynchronous, double-synchronous, or double synchronous + filter width) for eCAPx.

Figure 7-5. eCAPx Input Synchronization Selection Detail

7.2.1 Clock Enable Control for eCAPx Modules

Each of the eCAPx modules has a clock enable (ECAPxENCLK) which is controlled by its respective Peripheral Power Down bit in the PSPWRDWNCLR_x register of the PCR2 module. To properly reset the peripherals, the peripherals must be released from reset by setting the PENA bit of the CLKCNTL register in the system module. In addition, the peripherals must be released from their power down state by clearing the respective bit in the PSPWRDWNCLR_x register. By default, after reset, the peripherals are in the power down state.

Table 7-7. eCAPx Clock Enable Control

| eCAP MODULE INSTANCE | CONTROL REGISTER TO ENABLE CLOCK | DEFAULT VALUE |
|----------------------|----------------------------------|---------------|
| eCAP1 | PSPWRDWNCLR3[15] | 1 |
| eCAP2 | PSPWRDWNCLR3[8] | 1 |
| eCAP3 | PSPWRDWNCLR3[9] | 1 |
| eCAP4 | PSPWRDWNCLR3[10] | 1 |
| eCAP5 | PSPWRDWNCLR3[11] | 1 |
| eCAP6 | PSPWRDWNCLR3[4] | 1 |

7.2.2 PWM Output Capability of eCAPx

When not used in capture mode, each of the eCAPx modules can be used as a single-channel PWM output. This is called the Auxiliary PWM (APWM) mode of operation of the eCAPx modules. For more information, see the eCAP module chapter of the device-specific TRM.

7.2.3 Input Connection to eCAPx Modules

The input connection to each of the eCAPx modules can be selected between a double-VCLK3-synchronized input or a double-VCLK3-synchronized and filtered input, as listed in Table 7-8.

Table 7-8. Device-Level Input Connection to eCAPx Modules

| INPUT SIGNAL | CONTROL FOR DOUBLE-SYNCHRONIZED CONNECTION TO eCAPx | CONTROL FOR DOUBLE-SYNCHRONIZED AND FILTERED CONNECTION TO eCAPx ⁽¹⁾ |
|--------------|---|---|
| eCAP1 | PINMMR169[2:0] = 001 | PINMMR169[2:0] = 010 |
| eCAP2 | PINMMR169[10:8] = 001 | PINMMR169[10:8] = 010 |
| eCAP3 | PINMMR169[18:16] = 001 | PINMMR169[18:16] = 010 |
| eCAP4 | PINMMR169[26:24] = 001 | PINMMR169[26:24] = 010 |
| eCAP5 | PINMMR170[2:0] = 001 | PINMMR170[2:0] = 010 |
| eCAP6 | PINMMR170[10:8] = 001 | PINMMR170[10:8] = 010 |

(1) The filter width is 6 VCLK3 cycles.

7.2.4 Enhanced Capture Module (eCAP) Electrical Data/Timing

Table 7-9. eCAPx Timing Requirements

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|--------------|----------------------------|-------------------------------|--|-----|--------|
| $t_{w(CAP)}$ | Pulse width, capture input | Synchronous | 2 $t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | 2 $t_{c(VCLK3)}$ + filter width ⁽¹⁾ | | cycles |

(1) The filter width is 6 VCLK3 cycles.

Table 7-10. eCAPx Switching Characteristics

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
|---------------|--|-----|-----|------|
| $t_{w(APWM)}$ | Pulse duration, APWMx output high or low | 20 | | ns |

7.3 Enhanced Quadrature Encoder (eQEP)

Figure 7-6 shows the eQEP module interconnections on the device.

A. For more detail on the eQEPx input synchronization selection, see Figure 7-7.

Figure 7-6. eQEP Module Interconnections

Figure 7-7 shows the detailed input synchronization selection (asynchronous, double-synchronous, or double synchronous + filter width) for eQEPx.

Figure 7-7. eQEPx Input Synchronization Selection Detail

7.3.1 Clock Enable Control for eQEPx Modules

Each of the EQEPx modules has a clock enable (EQEPxENCLK) which is controlled by its respective Peripheral Power Down bit in the PSPWRDWNCLR_x register of the PCR2 module. To properly reset the peripherals, the peripherals must be released from reset by setting the PENA bit of the CLKCNTL register in the system module. In addition, the peripherals must be released from their power down state by clearing the respective bit in the PSPWRDWNCLR_x register. By default after reset, the peripherals are in power down state.

Table 7-11. eQEPx Clock Enable Control

| eQEP MODULE INSTANCE | CONTROL REGISTER TO ENABLE CLOCK | DEFAULT VALUE |
|----------------------|----------------------------------|---------------|
| eQEP1 | PSPWRDWNCLR3[5] | 1 |
| eQEP2 | PSPWRDWNCLR3[6] | 1 |

7.3.2 Using eQEPx Phase Error to Trip ePWMx Outputs

The eQEP module sets the EQEPERR signal output whenever a phase error is detected in its inputs EQEPxA and EQEPxB. This error signal from both the eQEP modules is input to the connection selection multiplexer. This multiplexer is defined in Table 7-3. As shown in Figure 7-6, the output of this selection multiplexer is inverted and connected to the TZ4n trip-zone input of all ePWMx modules. This connection allows the application to define the response of each ePWMx module on a phase error indicated by the eQEP modules.

7.3.3 Input Connection to eQEPx Modules

The input connection to each of the eQEP modules can be selected between a double-VCLK3-synchronized input or a double-VCLK3-synchronized and filtered input, as listed in Table 7-12.

Table 7-12. Device-Level Input Connection to eQEPx Modules

| INPUT SIGNAL | CONTROL FOR DOUBLE-SYNCHRONIZED CONNECTION TO eQEPx | CONTROL FOR DOUBLE-SYNCHRONIZED AND FILTERED CONNECTION ⁽¹⁾ TO eQEPx |
|--------------|---|---|
| eQEP1A | PINMMR170[18:16] = 001 | PINMMR170[18:16] = 010 |
| eQEP1B | PINMMR170[26:24] = 001 | PINMMR170[26:24] = 010 |
| eQEP1I | PINMMR171[2:0] = 001 | PINMMR171[2:0] = 010 |
| eQEP1S | PINMMR171[10:8] = 001 | PINMMR171[10:8] = 010 |
| eQEP2A | PINMMR171[18:16] = 001 | PINMMR171[18:16] = 010 |
| eQEP2B | PINMMR171[26:24] = 001 | PINMMR171[26:24] = 010 |
| eQEP2I | PINMMR172[2:0] = 001 | PINMMR172[2:0] = 010 |
| eQEP2S | PINMMR172[10:8] = 001 | PINMMR172[10:8] = 010 |

(1) The filter width is 6 VCLK3 cycles.

7.3.4 Enhanced Quadrature Encoder Pulse (eQEPx) Timing

Table 7-13. eQEPx Timing Requirements⁽¹⁾

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|-----------------|----------------------------|-------------------------------|---------------------------------|-----|--------|
| $t_{w(QEPP)}$ | QEP input period | Synchronous | 2 $t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | 2 $t_{c(VCLK3)}$ + filter width | | |
| $t_{w(INDEXH)}$ | QEP Index Input High Time | Synchronous | 2 $t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | 2 $t_{c(VCLK3)}$ + filter width | | |
| $t_{w(INDEXL)}$ | QEP Index Input Low Time | Synchronous | 2 $t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | 2 $t_{c(VCLK3)}$ + filter width | | |
| $t_{w(STROBH)}$ | QEP Strobe Input High Time | Synchronous | 2 $t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | 2 $t_{c(VCLK3)}$ + filter width | | |
| $t_{w(STROBL)}$ | QEP Strobe Input Low Time | Synchronous | 2 $t_{c(VCLK3)}$ | | cycles |
| | | Synchronous with input filter | 2 $t_{c(VCLK3)}$ + filter width | | |

(1) The filter width is 6 VCLK3 cycles.

Table 7-14. eQEPx Switching Characteristics

| PARAMETER | | MIN | MAX | UNIT |
|---------------------|--|-----|------------------|--------|
| $t_{d(CNTR)xin}$ | Delay time, external clock to counter increment | | 4 $t_{c(VCLK3)}$ | cycles |
| $t_{d(PCS-OUT)QEP}$ | Delay time, QEP input edge to position compare sync output | | 6 $t_{c(VCLK3)}$ | cycles |

7.4 12-bit Multibuffered Analog-to-Digital Converter (MibADC)

The MibADC has a separate power bus for its analog circuitry that enhances the Analog-to-Digital (A-to-D) performance by preventing digital switching noise on the logic circuitry which could be present on V_{SS} and V_{CC} from coupling into the A-to-D analog stage. All A-to-D specifications are given with respect to AD_{REFLO} , unless otherwise noted.

Table 7-15. MibADC Overview

| DESCRIPTION | VALUE |
|------------------------|---|
| Resolution | 12 bits |
| Monotonic | Assured |
| Output conversion code | 00h to FFFh [00 for $V_{AI} \leq AD_{REFLO}$; FFF for $V_{AI} \geq AD_{REFHI}$] |

7.4.1 MibADC Features

- 10-/12-bit resolution
- AD_{REFHI} and AD_{REFLO} pins (high and low reference voltages)
- Total Sample/Hold/Convert time: 600 ns Typical Minimum at 30 MHz ADCLK
- One memory region per conversion group is available (Event Group, Group 1, and Group 2)
- Allocation of channels to conversion groups is completely programmable
- Memory regions are serviced either by interrupt or by DMA
- Programmable interrupt threshold counter is available for each group
- Programmable magnitude threshold interrupt for each group for any one channel
- Option to read either 8-, 10-, or 12-bit values from memory regions
- Single or continuous conversion modes
- Embedded self-test
- Embedded calibration logic
- Enhanced power-down mode
 - Optional feature to automatically power down ADC core when no conversion is in progress
- External event pin (ADEV) programmable as general-purpose I/O

7.4.2 Event Trigger Options

The ADC module supports three conversion groups: Event Group, Group1, and Group2. Each of these three groups can be configured to be triggered by a hardware event. In that case, the application can select from among eight event sources to be the trigger for a group's conversions.

7.4.2.1 MibADC1 Event Trigger Hookup

[Table 7-16](#) lists the event sources that can trigger the conversions for the MibADC1 groups.

Table 7-16. MibADC1 Event Trigger Selection

| GROUP SOURCE SELECT BITS (G1SRC, G2SRC OR EVSRC) | EVENT NO. | PINMMR161[0] | PINMMR161[1] | CONTROL FOR OPTION A | CONTROL FOR OPTION B | TRIGGER SOURCE |
|---|-----------|--------------|--------------|-------------------------|-------------------------|----------------|
| 000 | 1 | x | x | — | — | AD1EVT |
| 001 | 2 | 1 | 0 | PINMMR161[8] = x | PINMMR161[9] = x | N2HET1[8] |
| | | 0 | 1 | PINMMR161[8] = 1 | PINMMR161[9] = 0 | N2HET2[5] |
| | | 0 | 1 | PINMMR161[8] = 0 | PINMMR161[9] = 1 | e_TPWM_B |
| 010 | 3 | 1 | 0 | — | — | N2HET1[10] |
| | | 0 | 1 | — | — | N2HET1[27] |
| 011 | 4 | 1 | 0 | PINMMR161[16] = x | PINMMR161[17] = x | RT11 Comp0 |
| | | 0 | 1 | PINMMR161[16] = 1 | PINMMR161[17] = 0 | RT11 Comp0 |
| | | 0 | 1 | PINMMR161[16] = 0 | PINMMR161[17] = 1 | e_TPWM_A1 |
| 100 | 5 | 1 | 0 | — | — | N2HET1[12] |
| | | 0 | 1 | — | — | N2HET1[17] |
| 101 | 6 | 1 | 0 | PINMMR161[24] = x | PINMMR161[25] = x | N2HET1[14] |
| | | 0 | 1 | PINMMR161[24] = 1 | PINMMR161[25] = 0 | N2HET1[19] |
| | | 0 | 1 | PINMMR161[24] = 0 | PINMMR161[25] = 1 | N2HET2[1] |
| 110 | 7 | 1 | 0 | PINMMR162[0] = x | PINMMR162[1] = x | GI0B[0] |
| | | 0 | 1 | PINMMR162[0] = 1 | PINMMR162[1] = 0 | N2HET1[11] |
| | | 0 | 1 | PINMMR162[0] = 0 | PINMMR162[1] = 1 | ePWM_A2 |
| 111 | 8 | 1 | 0 | PINMMR162[8] = x | PINMMR162[9] = x | GI0B[1] |
| | | 0 | 1 | PINMMR162[8] = 1 | PINMMR162[9] = 0 | N2HET2[13] |
| | | 0 | 1 | PINMMR162[8] = 0 | PINMMR162[9] = 1 | ePWM_AB |

NOTE

For ADEVT trigger source, the connection to the MibADC1 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by configuring ADEVT as an output function on to the pad (through the mux control), or by driving the ADEVT signal from an external trigger source as input. If the mux control module is used to select different functionality instead of the ADEVT signal, then care must be taken to disable ADEVT from triggering conversions; there is no multiplexing on the input connection.

If ePWM_B, ePWM_A2, ePWM_AB, N2HET2[1], N2HET2[5], N2HET2[13], N2HET1[11], N2HET1[17], or N2HET1[19] is used to trigger the ADC, the connection to the ADC is made directly from the N2HET or ePWM module outputs. As a result, the ADC can be triggered without having to enable the signal from being output on a device terminal.

NOTE

For N2HETx trigger sources, the connection to the MibADC1 module trigger input is made from the input side of the output buffer (at the N2HETx module boundary). This way, a trigger condition can be generated even if the N2HETx signal is not selected to be output on the pad.

NOTE

For the RTI compare 0 interrupt source, the connection is made directly from the output of the RTI module. That is, the interrupt condition can be used as a trigger source even if the actual interrupt is not signaled to the CPU.

7.4.2.2 MibADC2 Event Trigger Hookup

[Table 7-17](#) lists the event sources that can trigger the conversions for the MibADC2 groups.

Table 7-17. MibADC2 Event Trigger Selection

| GROUP SOURCE SELECT BITS (G1SRC, G2SRC, or EVSRC) | EVENT NO. | PINMMR161[0] | PINMMR161[1] | CONTROL FOR OPTION A | CONTROL FOR OPTION B | TRIGGER SOURCE |
|--|-----------|--------------|--------------|-------------------------|-------------------------|----------------|
| 000 | 1 | x | x | NA | NA | AD2EVT |
| 001 | 2 | 1 | 0 | PINMMR162[16] = x | PINMMR162[17] = x | N2HET1[8] |
| | | 0 | 1 | PINMMR162[16] = 1 | PINMMR162[17] = 0 | N2HET2[5] |
| | | 0 | 1 | PINMMR162[16] = 0 | PINMMR162[17] = 1 | e_TPWM_B |
| 010 | 3 | 1 | 0 | NA | NA | N2HET1[10] |
| | | 0 | 1 | NA | NA | N2HET1[27] |
| 011 | 4 | 1 | 0 | PINMMR162[24] = x | PINMMR162[25] = x | RTI1 Comp0 |
| | | 0 | 1 | PINMMR162[24] = 1 | PINMMR162[25] = 0 | RTI1 Comp0 |
| | | 0 | 1 | PINMMR162[24] = 0 | PINMMR162[25] = 1 | e_TPWM_A1 |
| 100 | 5 | 1 | 0 | NA | NA | N2HET1[12] |
| | | 0 | 1 | NA | NA | N2HET1[17] |
| 101 | 6 | 1 | 0 | PINMMR163[0] = x | PINMMR163[0] = x | N2HET1[14] |
| | | 0 | 1 | PINMMR163[0] = 1 | PINMMR163[0] = 0 | N2HET1[19] |
| | | 0 | 1 | PINMMR163[0] = 0 | PINMMR163[0] = 1 | N2HET2[1] |
| 110 | 7 | 1 | 0 | PINMMR163[8] = x | PINMMR163[8] = x | GIOB[0] |
| | | 0 | 1 | PINMMR163[8] = 1 | PINMMR163[8] = 0 | N2HET1[11] |
| | | 0 | 1 | PINMMR163[8] = 0 | PINMMR163[8] = 1 | ePWM_A2 |
| 111 | 8 | 1 | 0 | PINMMR163[16] = x | PINMMR163[16] = x | GIOB[1] |
| | | 0 | 1 | PINMMR163[16] = 1 | PINMMR163[16] = 0 | N2HET2[13] |
| | | 0 | 1 | PINMMR163[16] = 0 | PINMMR163[16] = 1 | ePWM_AB |

NOTE

For AD2EVT trigger source, the connection to the MibADC2 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by configuring AD2EVT as an output function on to the pad (through the mux control), or by driving the AD2EVT signal from an external trigger source as input. If the mux control module is used to select different functionality instead of the AD2EVT signal, then care must be taken to disable AD2EVT from triggering conversions; there is no multiplexing on the input connections.

If ePWM_B, ePWM_A2, ePWM_AB, N2HET2[1], N2HET2[5], N2HET2[13], N2HET1[11], N2HET1[17], or N2HET1[19] is used to trigger the ADC, the connection to the ADC is made directly from the N2HET or ePWM module outputs. As a result, the ADC can be triggered without having to enable the signal from being output on a device terminal.

NOTE

For N2HETx trigger sources, the connection to the MibADC2 module trigger input is made from the input side of the output buffer (at the N2HETx module boundary). This way, a trigger condition can be generated even if the N2HETx signal is not selected to be output on the pad.

NOTE

For the RTI compare 0 interrupt source, the connection is made directly from the output of the RTI module. That is, the interrupt condition can be used as a trigger source even if the actual interrupt is not signaled to the CPU.

7.4.2.3 Controlling ADC1 and ADC2 Event Trigger Options Using SOC Output from ePWM Modules

As shown in [Figure 7-8](#), the ePWMxSOCA and ePWMxSOCB outputs from each ePWM module are used to generate four signals – ePWM_B, ePWM_A1, ePWM_A2, and ePWM_AB, that are available to trigger the ADC based on the application requirement.

Figure 7-8. ADC Trigger Source Generation from ePWMx

Table 7-18. Control Bit to SOC Output

| CONTROL BIT | SOC OUTPUT |
|---------------|------------|
| PINMMR164[0] | SOC1A_SEL |
| PINMMR164[8] | SOC2A_SEL |
| PINMMR164[16] | SOC3A_SEL |
| PINMMR164[24] | SOC4A_SEL |
| PINMMR165[0] | SOC5A_SEL |
| PINMMR165[8] | SOC6A_SEL |
| PINMMR165[16] | SOC7A_SEL |

The SOCA output from each ePWM module is connected to a "switch" shown in Figure 7-8. This switch is implemented by using the control registers in the PINMMR module. Figure 7-9 is an example of the implementation is shown for the switch on SOC1A. The switches on the other SOCA signals are implemented in the same way.

Figure 7-9. ePWM1SOC1A Switch Implementation

The logic equations for the four outputs from the combinational logic shown in Figure 7-8 are:

$$ePWM_B = SOC1B \text{ or } SOC2B \text{ or } SOC3B \text{ or } SOC4B \text{ or } SOC5B \text{ or } SOC6B \text{ or } SOC7B \tag{1}$$

$$ePWM_A1 = [SOC1A \text{ and not}(SOC1A_SEL)] \text{ or } [SOC2A \text{ and not}(SOC2A_SEL)] \text{ or } [SOC3A \text{ and not}(SOC3A_SEL)] \text{ or } [SOC4A \text{ and not}(SOC4A_SEL)] \text{ or } [SOC5A \text{ and not}(SOC5A_SEL)] \text{ or } [SOC6A \text{ and not}(SOC6A_SEL)] \text{ or } [SOC7A \text{ and not}(SOC7A_SEL)] \tag{2}$$

$$ePWM_A2 = [SOC1A \text{ and } SOC1A_SEL] \text{ or } [SOC2A \text{ and } SOC2A_SEL] \text{ or } [SOC3A \text{ and } SOC3A_SEL] \text{ or } [SOC4A \text{ and } SOC4A_SEL] \text{ or } [SOC5A \text{ and } SOC5A_SEL] \text{ or } [SOC6A \text{ and } SOC6A_SEL] \text{ or } [SOC7A \text{ and } SOC7A_SEL] \tag{3}$$

$$ePWM_AB = ePWM_B \text{ or } ePWM_A2 \tag{4}$$

7.4.3 ADC Electrical and Timing Specifications

Table 7-19. MibADC Recommended Operating Conditions

| PARAMETER | | MIN | MAX | UNIT |
|---------------------|--|----------------------------------|----------------------------------|------|
| AD _{REFHI} | A-to-D high-voltage reference source | AD _{REFLO} | V _{CCAD} ⁽¹⁾ | V |
| AD _{REFLO} | A-to-D low-voltage reference source | V _{SSAD} ⁽¹⁾ | AD _{REFHI} | V |
| V _{AI} | Analog input voltage | AD _{REFLO} | AD _{REFHI} | V |
| I _{AIC} | Analog input clamp current ⁽²⁾ (V _{AI} < V _{SSAD} – 0.3 or V _{AI} > V _{CCAD} + 0.3) | –2 | 2 | mA |

(1) For V_{CCAD} and V_{SSAD} recommended operating conditions, see [Section 5.4](#).

(2) Input currents into any ADC input channel outside the specified limits could affect conversion results of other channels.

Table 7-20. MibADC Electrical Characteristics Over Full Ranges of Recommended Operating Conditions⁽¹⁾

| PARAMETER | | DESCRIPTION/CONDITIONS | MIN | MAX | UNIT | |
|----------------------------------|--|---------------------------------|---|-------|------|----|
| R _{mux} | Analog input mux on-resistance | See Figure 7-10 | | 250 | Ω | |
| R _{samp} | ADC sample switch on-resistance | See Figure 7-10 | | 250 | Ω | |
| C _{mux} | Input mux capacitance | See Figure 7-10 | | 16 | pF | |
| C _{samp} | ADC sample capacitance | See Figure 7-10 | | 13 | pF | |
| I _{AiL} | Analog off-state input leakage current | V _{CCAD} = 3.6 V | V _{SSAD} ≤ V _{IN} < V _{SSAD} + 100 mV | –300 | 200 | nA |
| | | | V _{SSAD} + 100 mV ≤ V _{IN} ≤ V _{CCAD} – 200 mV | –200 | 200 | |
| | | | V _{CCAD} – 200 mV < V _{IN} ≤ V _{CCAD} | –200 | 500 | |
| I _{AiL} | Analog off-state input leakage current | V _{CCAD} = 5.25 V | V _{SSAD} ≤ V _{IN} < V _{SSAD} + 300 mV | –1000 | 250 | nA |
| | | | V _{SSAD} + 300 mV ≤ V _{IN} ≤ V _{CCAD} – 300 mV | –250 | 250 | |
| | | | V _{CCAD} – 300 mV < V _{IN} ≤ V _{CCAD} | –250 | 1000 | |
| I _{AOSB} ⁽²⁾ | Analog on-state input bias current | V _{CCAD} = 3.6 V | V _{SSAD} ≤ V _{IN} < V _{SSAD} + 100 mV | –10 | 2 | μA |
| | | | V _{SSAD} + 100 mV < V _{IN} < V _{CCAD} – 200 mV | –4 | 2 | |
| | | | V _{CCAD} – 200 mV < V _{IN} < V _{CCAD} | –4 | 16 | |
| I _{AOSB} ⁽²⁾ | Analog on-state input bias current | V _{CCAD} = 5.25 V | V _{SSAD} ≤ V _{IN} < V _{SSAD} + 300 mV | –12 | 3 | μA |
| | | | V _{SSAD} + 300 mV ≤ V _{IN} ≤ V _{CCAD} – 300 mV | –5 | 3 | |
| | | | V _{CCAD} – 300 mV < V _{IN} ≤ V _{CCAD} | –5 | 18 | |

(1) For I_{CCAD} and I_{CCREFHI} see [Section 5.7](#).

(2) If a shared channel is being converted by both ADC converters at the same time, the on-state leakage is doubled.

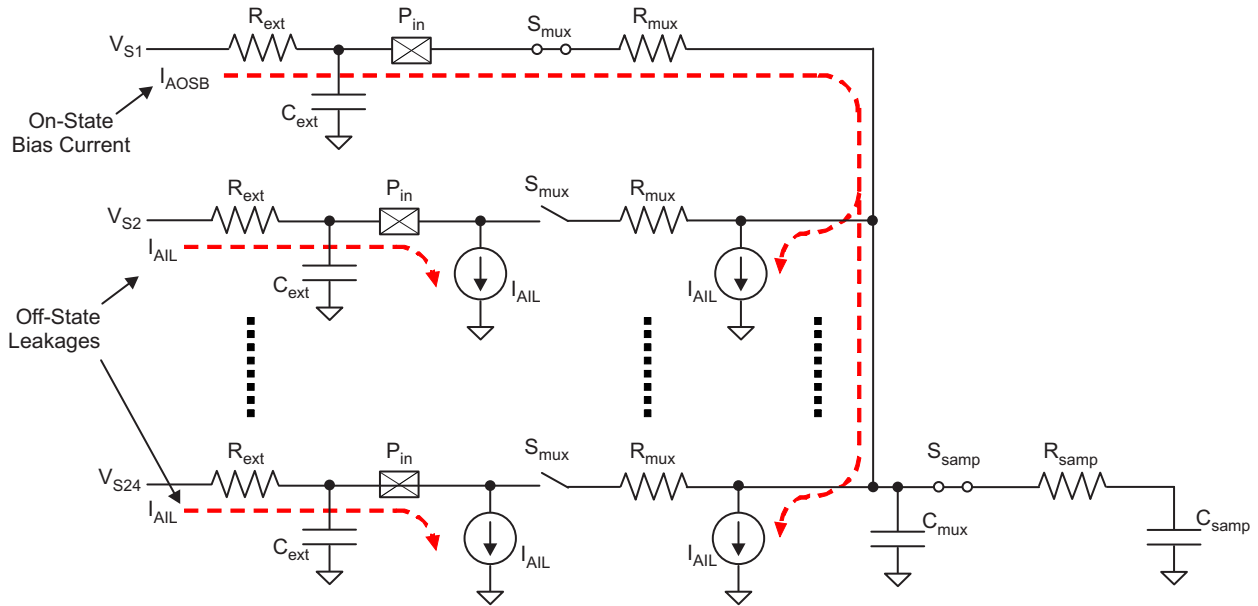

Figure 7-10. MibADC Input Equivalent Circuit

Table 7-21. MibADC Timing Specifications

| PARAMETER | | MIN | NOM | MAX | UNIT |
|----------------------|---|-------|-----|-----|---------------|
| $t_{c(ADCLK)}^{(1)}$ | Cycle time, MibADC clock | 0.033 | | | μs |
| $t_{d(SH)}^{(2)}$ | Delay time, sample and hold time | 0.2 | | | μs |
| 12-BIT MODE | | | | | |
| $t_{d(C)}$ | Delay time, conversion time | 0.4 | | | μs |
| $t_{d(SHC)}^{(3)}$ | Delay time, total sample/hold and conversion time | 0.6 | | | μs |
| 10-BIT MODE | | | | | |
| $t_{d(C)}$ | Delay time, conversion time | 0.33 | | | μs |
| $t_{d(SHC)}^{(3)}$ | Delay time, total sample/hold and conversion time | 0.53 | | | μs |

- (1) The MibADC clock is the ADCLK, generated by dividing down the VCLK1 by a prescale factor defined by the ADCLOCKCR register bits 4:0.
- (2) The sample and hold time for the ADC conversions is defined by the ADCLK frequency and the AD<GP>SAMP register for each conversion group. The sample time must be determined by accounting for the external impedance connected to the input channel as well as the internal impedance of the ADC.
- (3) This is the minimum sample/hold and conversion time that can be achieved. These parameters are dependent on many factors (for example, the prescale settings).

Table 7-22. MibADC Operating Characteristics Over 3.0 V to 3.6 V Operating Conditions⁽¹⁾⁽²⁾

| PARAMETER | | DESCRIPTION/CONDITIONS | MIN | MAX | UNIT |
|----------------------|--|--|-------------|-----|------|
| CR | Conversion range over which specified accuracy is maintained | AD _{REFHI} - AD _{REFLO} | 3 | 3.6 | V |
| Z _{SE} T | Zero Scale Offset | Difference between the first ideal transition (from code 000h to 001h) and the actual transition | 10-bit mode | 1 | LSB |
| | | | 12-bit mode | 2 | LSB |
| F _{SE} T | Full Scale Offset | Difference between the range of the measured code transitions (from first to last) and the range of the ideal code transitions | 10-bit mode | 2 | LSB |
| | | | 12-bit mode | 3 | LSB |
| E _{DN} L | Differential nonlinearity error | Difference between the actual step width and the ideal value. (See Figure 7-11) | 10-bit mode | -1 | 1.5 |
| | | | 12-bit mode | -1 | 2 |
| E _{IN} L | Integral nonlinearity error | Maximum deviation from the best straight line through the MibADC. MibADC transfer characteristics, excluding the quantization error. | 10-bit mode | -2 | 2 |
| | | | 12-bit mode | -2 | 2 |
| E _{TO} T | Total unadjusted error (after calibration) | Maximum value of the difference between an analog value and the ideal midstep value. | 10-bit mode | -2 | 2 |
| | | | 12-bit mode | -4 | 4 |

(1) 1 LSB = (AD_{REFHI} - AD_{REFLO}) / 2¹² for 12-bit mode

(2) 1 LSB = (AD_{REFHI} - AD_{REFLO}) / 2¹⁰ for 10-bit mode

Table 7-23. MibADC Operating Characteristics Over 3.6 V to 5.25 V Operating Conditions⁽¹⁾⁽²⁾

| PARAMETER | | DESCRIPTION/CONDITIONS | MIN | MAX | UNIT |
|----------------------|--|--|-------------|------|------|
| CR | Conversion range over which specified accuracy is maintained | AD _{REFHI} - AD _{REFLO} | 3.6 | 5.25 | V |
| Z _{SE} T | Zero Scale Offset | Difference between the first ideal transition (from code 000h to 001h) and the actual transition | 10-bit mode | 1 | LSB |
| | | | 12-bit mode | 2 | LSB |
| F _{SE} T | Full Scale Offset | Difference between the range of the measured code transitions (from first to last) and the range of the ideal code transitions | 10-bit mode | 2 | LSB |
| | | | 12-bit mode | 3 | LSB |
| E _{DN} L | Differential nonlinearity error | Difference between the actual step width and the ideal value. (See Figure 7-11) | 10-bit mode | -1 | 1.5 |
| | | | 12-bit mode | -1 | 3 |
| E _{IN} L | Integral nonlinearity error | Maximum deviation from the best straight line through the MibADC. MibADC transfer characteristics, excluding the quantization error. | 10-bit mode | -2 | 2 |
| | | | 12-bit mode | -4.5 | 2 |
| E _{TO} T | Total unadjusted error (after calibration) | Maximum value of the difference between an analog value and the ideal midstep value. | 10-bit mode | -2 | 2 |
| | | | 12-bit mode | -6 | 5 |

(1) 1 LSB = (AD_{REFHI} - AD_{REFLO}) / 2¹² for 12-bit mode

(2) 1 LSB = (AD_{REFHI} - AD_{REFLO}) / 2¹⁰ for 10-bit mode

7.4.4 Performance (Accuracy) Specifications

7.4.4.1 MibADC Nonlinearity Errors

The differential nonlinearity error shown in [Figure 7-11](#) (sometimes referred to as differential linearity) is the difference between an actual step width and the ideal value of 1 LSB.

A. $1 \text{ LSB} = (AD_{\text{REFHI}} - AD_{\text{REFLO}}) / 2^{12}$

Figure 7-11. Differential Nonlinearity (DNL) Error

The integral nonlinearity error shown in Figure 7-12 (sometimes referred to as linearity error) is the deviation of the values on the actual transfer function from a straight line.

A. $1 \text{ LSB} = (AD_{\text{REFHI}} - AD_{\text{REFLO}}) / 2^{12}$

Figure 7-12. Integral Nonlinearity (INL) Error^(A)

7.4.4.2 MibADC Total Error

The absolute accuracy or total error of an MibADC as shown in Figure 7-13 is the maximum value of the difference between an analog value and the ideal midstep value.

A. $1 \text{ LSB} = (AD_{REFHI} - AD_{REFLO})/2^{12}$

Figure 7-13. Absolute Accuracy (Total) Error^(A)

7.5 General-Purpose Input/Output

The GPIO module on this device supports two ports, GIOA and GIOB. The I/O pins are bidirectional and bit-programmable. Both GIOA and GIOB support external interrupt capability.

7.5.1 Features

The GPIO module has the following features:

- Each I/O pin can be configured as:
 - Input
 - Output
 - Open Drain
- The interrupts have the following characteristics:
 - Programmable interrupt detection either on both edges or on a single edge (set in GIOINTDET)
 - Programmable edge-detection polarity, either rising or falling edge (set in GIOPOL register)
 - Individual interrupt flags (set in GIOFLG register)
 - Individual interrupt enables, set and cleared through GIOENASET and GIOENACLR registers respectively
 - Programmable interrupt priority, set through GIOLVLSET and GIOLVLCLR registers
- Internal pullup/pulldown allows unused I/O pins to be left unconnected

For information on input and output timings see [Section 5.10.1](#) and [Section 5.10.2](#).

7.6 Enhanced High-End Timer (N2HET)

The N2HET is an advanced intelligent timer that provides sophisticated timing functions for real-time applications. The timer is software-controlled, using a reduced instruction set, with a specialized timer micromachine and an attached I/O port. The N2HET can be used for pulse width modulated outputs, capture or compare inputs, or general-purpose I/O. It is especially well suited for applications requiring multiple sensor information and drive actuators with complex and accurate time pulses.

7.6.1 Features

The N2HET module has the following features:

- Programmable timer for input and output timing functions
- Reduced instruction set (30 instructions) for dedicated time and angle functions
- 256 words of instruction RAM protected by parity
- User defined number of 25-bit virtual counters for timer, event counters and angle counters
- 7-bit hardware counters for each pin allow up to 32-bit resolution in conjunction with the 25-bit virtual counters
- Up to 32 pins usable for input signal measurements or output signal generation
- Programmable suppression filter for each input pin with adjustable limiting frequency
- Low CPU overhead and interrupt load
- Efficient data transfer to or from the CPU memory with dedicated High-End-Timer Transfer Unit (HTU) or DMA
- Diagnostic capabilities with different loopback mechanisms and pin status readback functionality

7.6.2 N2HET RAM Organization

The timer RAM uses 4 RAM banks, where each bank has two port access capability. This means that one RAM address may be written while another address is read. The RAM words are 96-bits wide, which are split into three 32-bit fields (program, control, and data).

7.6.3 Input Timing Specifications

The N2HET instructions PCNT and WCAP impose some timing constraints on the input signals.

Figure 7-14. N2HET Input Capture Timings

Table 7-24. Dynamic Characteristics for the N2HET Input Capture Functionality

| | PARAMETER | MIN | MAX | UNIT |
|---|---|--------------------------------|---|------|
| 1 | Input signal period, PCNT or WCAP for rising edge to rising edge | (HRP) (LRP) $t_{C(VCLK2)} + 2$ | 2^{25} (HRP) (LRP) $t_{C(VCLK2)} - 2$ | ns |
| 2 | Input signal period, PCNT or WCAP for falling edge to falling edge | (HRP) (LRP) $t_{C(VCLK2)} + 2$ | 2^{25} (HRP) (LRP) $t_{C(VCLK2)} - 2$ | ns |
| 3 | Input signal high phase, PCNT or WCAP for rising edge to falling edge | 2 (HRP) $t_{C(VCLK2)} + 2$ | 2^{25} (HRP) (LRP) $t_{C(VCLK2)} - 2$ | ns |
| 4 | Input signal low phase, PCNT or WCAP for falling edge to rising edge | 2 (HRP) $t_{C(VCLK2)} + 2$ | 2^{25} (HRP) (LRP) $t_{C(VCLK2)} - 2$ | ns |

7.6.4 N2HET1-N2HET2 Interconnections

In some applications the N2HET resolutions must be synchronized. Some other applications require a single time base to be used for all PWM outputs and input timing captures.

The N2HET provides such a synchronization mechanism. The Clk_master/slave (HETGCR.16) configures the N2HET in master or slave mode (default is slave mode). A N2HET in master mode provides a signal to synchronize the prescalers of the slave N2HET. The slave N2HET synchronizes its loop resolution to the loop resolution signal sent by the master. The slave does not require this signal after it receives the first synchronization signal. However, anytime the slave receives the resynchronization signal from the master, the slave must synchronize itself again..

Figure 7-15. N2HET1 – N2HET2 Synchronization Hookup

7.6.5 N2HET Checking

7.6.5.1 Internal Monitoring

To assure correctness of the high-end timer operation and output signals, the two N2HET modules can be used to monitor each other's signals as shown in Figure 7-16. The direction of the monitoring is controlled by the I/O multiplexing control module.

Figure 7-16. N2HET Monitoring

7.6.5.2 Output Monitoring using Dual Clock Comparator (DCC)

N2HET1[31] is connected as a clock source for counter 1 in DCC1. This allows the application to measure the frequency of the pulse-width modulated (PWM) signal on N2HET1[31].

Similarly, N2HET2[0] is connected as a clock source for counter 1 in DCC2. This allows the application to measure the frequency of the pulse-width modulated (PWM) signal on N2HET2[0].

Both N2HET1[31] and N2HET2[0] can be configured to be internal-only channels. That is, the connection to the DCC module is made directly from the output of the N2HETx module (from the input of the output buffer).

For more information on DCC see [Section 6.7.3](#).

7.6.6 **Disabling N2HET Outputs**

Some applications require the N2HET outputs to be disabled under some fault condition. The N2HET module provides this capability through the "Pin Disable" input signal. This signal, when driven low, causes the N2HET outputs identified by a programmable register (HETPINDIS) to be tri-stated. Refer to the IOMM chapter in the device specific technical reference manual for more details on the "N2HET Pin Disable" feature.

GIOA[5] is connected to the "Pin Disable" input for N2HET1, and GIOB[2] is connected to the "Pin Disable" input for N2HET2.

7.6.7 High-End Timer Transfer Unit (HET-TU)

A High End Timer Transfer Unit (HET-TU) can perform DMA type transactions to transfer N2HET data to or from main memory. A Memory Protection Unit (MPU) is built into the HET-TU.

7.6.7.1 Features

- CPU and DMA independent
- Master Port to access system memory
- 8 control packets supporting dual buffer configuration
- Control packet information is stored in RAM protected by parity
- Event synchronization (HET transfer requests)
- Supports 32 or 64 bit transactions
- Addressing modes for HET address (8 byte or 16 byte) and system memory address (fixed, 32 bit or 64bit)
- One shot, circular and auto switch buffer transfer modes
- Request lost detection

7.6.7.2 Trigger Connections

Table 7-25. HET TU1 Request Line Connection

| Modules | Request Source | HET TU1 Request |
|---------|----------------|-----------------|
| N2HET1 | HTUREQ[0] | HET TU1 DCP[0] |
| N2HET1 | HTUREQ[1] | HET TU1 DCP[1] |
| N2HET1 | HTUREQ[2] | HET TU1 DCP[2] |
| N2HET1 | HTUREQ[3] | HET TU1 DCP[3] |
| N2HET1 | HTUREQ[4] | HET TU1 DCP[4] |
| N2HET1 | HTUREQ[5] | HET TU1 DCP[5] |
| N2HET1 | HTUREQ[6] | HET TU1 DCP[6] |
| N2HET1 | HTUREQ[7] | HET TU1 DCP[7] |

Table 7-26. HET TU2 Request Line Connection

| Modules | Request Source | HET TU2 Request |
|---------|----------------|-----------------|
| N2HET2 | HTUREQ[0] | HET TU2 DCP[0] |
| N2HET2 | HTUREQ[1] | HET TU2 DCP[1] |
| N2HET2 | HTUREQ[2] | HET TU2 DCP[2] |
| N2HET2 | HTUREQ[3] | HET TU2 DCP[3] |
| N2HET2 | HTUREQ[4] | HET TU2 DCP[4] |
| N2HET2 | HTUREQ[5] | HET TU2 DCP[5] |
| N2HET2 | HTUREQ[6] | HET TU2 DCP[6] |
| N2HET2 | HTUREQ[7] | HET TU2 DCP[7] |

7.7 Controller Area Network (DCAN)

The DCAN supports the CAN 2.0B protocol standard and uses a serial, multimaster communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 megabit per second (Mbps). The DCAN is ideal for applications operating in noisy and harsh environments (e.g., automotive and industrial fields) that require reliable serial communication or multiplexed wiring.

7.7.1 Features

Features of the DCAN module include:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- The CAN kernel can be clocked by the oscillator for baud-rate generation.
- 64 mailboxes on each DCAN
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Message RAM protected by ECC
- Direct access to Message RAM during test mode
- CAN Rx / Tx pins configurable as general purpose IO pins
- Message RAM Auto Initialization
- DMA support

For more information on the DCAN see the device specific technical reference manual.

7.7.2 Electrical and Timing Specifications

Table 7-27. Dynamic Characteristics for the DCANx TX and RX pins

| Parameter | | MIN | MAX | Unit |
|-----------------|--|-----|-----|------|
| $t_{d(CANnTX)}$ | Delay time, transmit shift register to CANnTX pin ⁽¹⁾ | | 15 | ns |
| $t_{d(CANnRX)}$ | Delay time, CANnRX pin to receive shift register | | 5 | ns |

(1) These values do not include rise/fall times of the output buffer.

7.8 Local Interconnect Network Interface (LIN)

The SCI/LIN module can be programmed to work either as an SCI or as a LIN. The core of the module is an SCI. The SCI's hardware features are augmented to achieve LIN compatibility.

The SCI module is a universal asynchronous receiver-transmitter that implements the standard nonreturn to zero format. The SCI can be used to communicate, for example, through an RS-232 port or over a K-line.

The LIN standard is based on the SCI (UART) serial data link format. The communication concept is single-master/multiple-slave with a message identification for multicast transmission between any network nodes.

7.8.1 LIN Features

The following are features of the LIN module:

- Compatible to LIN 1.3, 2.0 and 2.1 protocols
- Multibuffered receive and transmit units DMA capability for minimal CPU intervention
- Identification masks for message filtering
- Automatic Master Header Generation
 - Programmable Synch Break Field
 - Synch Field
 - Identifier Field
- Slave Automatic Synchronization
 - Synch break detection
 - Optional baudrate update
 - Synchronization Validation
- 2^{31} programmable transmission rates with 7 fractional bits
- Error detection
- 2 Interrupt lines with priority encoding

7.9 Serial Communication Interface (SCI)

7.9.1 Features

- Standard universal asynchronous receiver-transmitter (UART) communication
- Supports full- or half-duplex operation
- Standard nonreturn to zero (NRZ) format
- Double-buffered receive and transmit functions
- Configurable frame format of 3 to 13 bits per character based on the following:
 - Data word length programmable from one to eight bits
 - Additional address bit in address-bit mode
 - Parity programmable for zero or one parity bit, odd or even parity
 - Stop programmable for one or two stop bits
- Asynchronous or isosynchronous communication modes
- Two multiprocessor communication formats allow communication between more than two devices.
- Sleep mode is available to free CPU resources during multiprocessor communication.
- The 24-bit programmable baud rate supports 2^{24} different baud rates provide high accuracy baud rate selection.
- Four error flags and Five status flags provide detailed information regarding SCI events.
- Capability to use DMA for transmit and receive data.

7.10 Inter-Integrated Circuit (I2C)

The inter-integrated circuit (I2C) module is a multimaster communication module providing an interface between the RM4x microcontroller and devices compliant with Philips Semiconductor I2C-bus specification version 2.1 and connected by an I2C-bus. This module will support any slave or master I2C compatible device.

7.10.1 Features

The I2C has the following features:

- Compliance to the Philips I2C bus specification, v2.1 (The I2C Specification, Philips document number 9398 393 40011)
 - Bit/Byte format transfer
 - 7-bit and 10-bit device addressing modes
 - General call
 - START byte
 - Multimaster transmitter/ slave receiver mode
 - Multimaster receiver/ slave transmitter mode
 - Combined master transmit/receive and receive/transmit mode
 - Transfer rates of 10 kbps up to 400 kbps (Phillips fast-mode rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Seven interrupts that can be used by the CPU
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

NOTE

This I2C module does not support:

- High-speed (HS) mode
 - C-bus compatibility mode
 - The combined format in 10-bit address mode (the I2C sends the slave address second byte every time it sends the slave address first byte)
-

7.10.2 I2C I/O Timing Specifications

Table 7-28. I2C Signals (SDA and SCL) Switching Characteristics⁽¹⁾

| PARAMETER | | STANDARD MODE | | FAST MODE | | UNIT |
|----------------------|--|---------------|---------------------|-----------|-----|---------|
| | | MIN | MAX | MIN | MAX | |
| $t_{c(I2CCLK)}$ | Cycle time, Internal Module clock for I2C, prescaled from VCLK | 75.2 | 149 | 75.2 | 149 | ns |
| $f_{(SCL)}$ | SCL Clock frequency | 0 | 100 | 0 | 400 | kHz |
| $t_{c(SCL)}$ | Cycle time, SCL | 10 | | 2.5 | | μ s |
| $t_{su(SCLH-SDAL)}$ | Setup time, SCL high before SDA low (for a repeated START condition) | 4.7 | | 0.6 | | μ s |
| $t_{h(SCLL-SDAL)}$ | Hold time, SCL low after SDA low (for a repeated START condition) | 4 | | 0.6 | | μ s |
| $t_{w(SCLL)}$ | Pulse duration, SCL low | 4.7 | | 1.3 | | μ s |
| $t_{w(SCLH)}$ | Pulse duration, SCL high | 4 | | 0.6 | | μ s |
| $t_{su(SDA-SCLH)}$ | Setup time, SDA valid before SCL high | 250 | | 100 | | ns |
| $t_{h(SDA-SCLL)}$ | Hold time, SDA valid after SCL low (for I2C bus devices) | 0 | 3.45 ⁽²⁾ | 0 | 0.9 | μ s |
| $t_{w(SDAH)}$ | Pulse duration, SDA high between STOP and START conditions | 4.7 | | 1.3 | | μ s |
| $t_{su(SCLH-SDAH)}$ | Setup time, SCL high before SDA high (for STOP condition) | 4.0 | | 0.6 | | μ s |
| $t_{w(SP)}$ | Pulse duration, spike (must be suppressed) | | | 0 | 50 | ns |
| C_b ⁽³⁾ | Capacitive load for each bus line | | 400 | | 400 | pF |

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) The maximum $t_{h(SDA-SCLL)}$ for I2C bus devices has only to be met if the device does not stretch the low period ($t_{w(SCLL)}$) of the SCL signal.
- (3) C_b = The total capacitance of one bus line in pF.

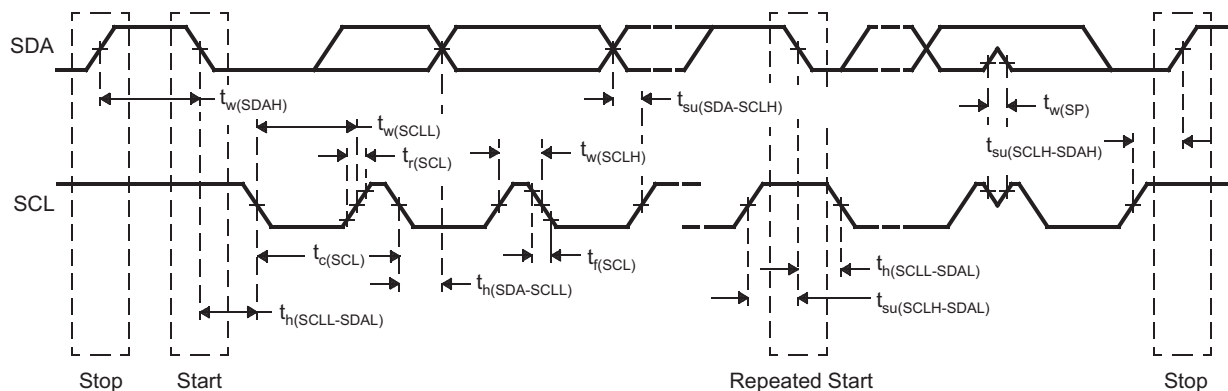

Figure 7-17. I2C Timings

NOTE

- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL.
 - The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the LOW period ($t_{w(SCLL)}$) of the SCL signal.
 - A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{su(SDA-SCLH)}$.
 - C_b = total capacitance of one bus line in pF. If mixed with fast-mode devices, faster fall-times are allowed.
-

7.11 Multibuffered / Standard Serial Peripheral Interface

The MibSPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted in and out of the device at a programmed bit-transfer rate. Typical applications for the SPI include interfacing to external peripherals, such as I/Os, memories, display drivers, and analog-to-digital converters.

7.11.1 Features

Both Standard and MibSPI modules have the following features:

- 16-bit shift register
- Receive buffer register
- 11-bit baud clock generator
- SPICLK can be internally-generated (master mode) or received from an external clock source (slave mode)
- Each word transferred can have a unique format
- SPI I/Os not used in the communication can be used as digital input/output signals

Table 7-29. MibSPI Configurations

| MibSPIx/SPIx | I/Os |
|--------------|--|
| MibSPI1 | MIBSPI1SIMO[1:0], MIBSPI1SOMI[1:0], MIBSPI1CLK, MIBSPI1nCS[5:0], MIBSPI1nENA |
| MibSPI3 | MIBSPI3SIMO, MIBSPI3SOMI, MIBSPI3CLK, MIBSPI3nCS[5:0], MIBSPI3nENA |
| MibSPI5 | MIBSPI5SIMO[3:0], MIBSPI5SOMI[3:0], MIBSPI5CLK, MIBSPI5nCS[5:0], MIBSPI5nENA |
| MibSPI2 | MIBSPI2SIMO, MIBSPI2SOMI, MIBSPI2CLK, MIBSPI2nCS[1:0], MIBSPI2nENA |
| MibSPI4 | MIBSPI4SIMO, MIBSPI4SOMI, MIBSPI4CLK, MIBSPI4nCS[5:0], MIBSPI4nENA |

7.11.2 MibSPI Transmit and Receive RAM Organization

The Multibuffer RAM is comprised of 256 buffers for MibSPI1 and 128 buffers for all other MibSPI. Each entry in the Multibuffer RAM consists of 4 parts: a 16-bit transmit field, a 16-bit receive field, a 16-bit control field and a 16-bit status field. The Multibuffer RAM can be partitioned into multiple transfer groups with a variable number of buffers each.

Multibuffered RAM Transfer Groups

| MibSPIx/SPIx MODULES | NO OF CHIP SELECTS | MIBSPIxnCS[x] | NO. OF RAM BUFFERS | NO. OF TRANSFER GROUPS |
|----------------------|--------------------|-----------------|--------------------|------------------------|
| MibSPI1 | 6 | MIBSPI1nCS[5:0] | 256 | 8 |
| MibSPI2 | 2 | MIBSPI2nCS[1:0] | 128 | 8 |
| MibSPI3 | 6 | MIBSPI3nCS[5:0] | 128 | 8 |
| MibSPI4 | 6 | MIBSPI4nCS[5:0] | 128 | 8 |
| MibSPI5 | 6 | MIBSPI5nCS[5:0] | 128 | 8 |

7.11.3 MibSPI Transmit Trigger Events

Each of the transfer groups can be configured individually. For each of the transfer groups a trigger event and a trigger source can be chosen. A trigger event can be for example a rising edge or a permanent low level at a selectable trigger source. For example, up to 15 trigger sources are available which can be used by each transfer group.

7.11.3.1 MIBSPI1 Event Trigger Hookup

Table 7-30. MIBSPI1 Event Trigger Hookup

| Event # | TGxCTRL TRIGSRC[3:0] | Trigger |
|----------|----------------------|---------------------|
| Disabled | 0000 | No trigger source |
| EVENT0 | 0001 | GIOA[0] |
| EVENT1 | 0010 | GIOA[1] |
| EVENT2 | 0011 | GIOA[2] |
| EVENT3 | 0100 | GIOA[3] |
| EVENT4 | 0101 | GIOA[4] |
| EVENT5 | 0110 | GIOA[5] |
| EVENT6 | 0111 | GIOA[6] |
| EVENT7 | 1000 | GIOA[7] |
| EVENT8 | 1001 | N2HET1[8] |
| EVENT9 | 1010 | N2HET1[10] |
| EVENT10 | 1011 | N2HET1[12] |
| EVENT11 | 1100 | N2HET1[14] |
| EVENT12 | 1101 | N2HET1[16] |
| EVENT13 | 1110 | N2HET1[18] |
| EVENT14 | 1111 | Intern Tick counter |

NOTE

For N2HET1 trigger sources, the connection to the MibSPI1 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI1 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin plus selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI1 transfers; there is no multiplexing on the input connections.

7.11.3.2 MIBSPI2 Event Trigger Hookup

Table 7-31. MIBSPI2 Event Trigger Hookup

| Event # | TGxCTRL TRIGSRC[3:0] | Trigger |
|----------|----------------------|---------------------|
| Disabled | 0000 | No trigger source |
| EVENT0 | 0001 | GIOA[0] |
| EVENT1 | 0010 | GIOA[1] |
| EVENT2 | 0011 | GIOA[2] |
| EVENT3 | 0100 | GIOA[3] |
| EVENT4 | 0101 | GIOA[4] |
| EVENT5 | 0110 | GIOA[5] |
| EVENT6 | 0111 | GIOA[6] |
| EVENT7 | 1000 | GIOA[7] |
| EVENT8 | 1001 | N2HET1[8] |
| EVENT9 | 1010 | N2HET1[10] |
| EVENT10 | 1011 | N2HET1[12] |
| EVENT11 | 1100 | N2HET1[14] |
| EVENT12 | 1101 | N2HET1[16] |
| EVENT13 | 1110 | N2HET1[18] |
| EVENT14 | 1111 | Intern Tick counter |

NOTE

For N2HET1 trigger sources, the connection to the MibSPI1 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI1 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin plus selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI1 transfers; there is no multiplexing on the input connections.

7.11.3.3 MIBSPI3 Event Trigger Hookup

Table 7-32. MIBSPI3 Event Trigger Hookup

| Event # | TGxCTRL TRIGSRC[3:0] | Trigger |
|----------|----------------------|-------------------|
| Disabled | 0000 | No trigger source |
| EVENT0 | 0001 | GIOA[0] |
| EVENT1 | 0010 | GIOA[1] |
| EVENT2 | 0011 | GIOA[2] |
| EVENT3 | 0100 | GIOA[3] |
| EVENT4 | 0101 | GIOA[4] |
| EVENT5 | 0110 | GIOA[5] |
| EVENT6 | 0111 | GIOA[6] |
| EVENT7 | 1000 | GIOA[7] |
| EVENT8 | 1001 | H2ET1[8] |

Table 7-32. MIBSPI3 Event Trigger Hookup (continued)

| Event # | TGxCTRL TRIGSRC[3:0] | Trigger |
|---------|----------------------|---------------------|
| EVENT9 | 1010 | N2HET1[10] |
| EVENT10 | 1011 | N2HET1[12] |
| EVENT11 | 1100 | N2HET1[14] |
| EVENT12 | 1101 | N2HET1[16] |
| EVENT13 | 1110 | N2HET1[18] |
| EVENT14 | 1111 | Intern Tick counter |

NOTE

For N2HET1 trigger sources, the connection to the MibSPI3 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI3 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin plus selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI3 transfers; there is no multiplexing on the input connections.

7.11.3.4 MIBSPI4 Event Trigger Hookup

Table 7-33. MIBSPI4 Event Trigger Hookup

| Event # | TGxCTRL TRIGSRC[3:0] | Trigger |
|----------|----------------------|---------------------|
| Disabled | 0000 | No trigger source |
| EVENT0 | 0001 | GIOA[0] |
| EVENT1 | 0010 | GIOA[1] |
| EVENT2 | 0011 | GIOA[2] |
| EVENT3 | 0100 | GIOA[3] |
| EVENT4 | 0101 | GIOA[4] |
| EVENT5 | 0110 | GIOA[5] |
| EVENT6 | 0111 | GIOA[6] |
| EVENT7 | 1000 | GIOA[7] |
| EVENT8 | 1001 | N2HET1[8] |
| EVENT9 | 1010 | N2HET1[10] |
| EVENT10 | 1011 | N2HET1[12] |
| EVENT11 | 1100 | N2HET1[14] |
| EVENT12 | 1101 | N2HET1[16] |
| EVENT13 | 1110 | N2HET1[18] |
| EVENT14 | 1111 | Intern Tick counter |

NOTE

For N2HET1 trigger sources, the connection to the MibSPI1 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI1 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin plus selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI1 transfers; there is no multiplexing on the input connections.

7.11.3.5 MIBSPI5 Event Trigger Hookup

Table 7-34. MIBSPI5 Event Trigger Hookup

| Event # | TGxCTRL TRIGSRC[3:0] | Trigger |
|----------|----------------------|-------------------|
| Disabled | 0000 | No trigger source |
| EVENT0 | 0001 | GIOA[0] |
| EVENT1 | 0010 | GIOA[1] |
| EVENT2 | 0011 | GIOA[2] |
| EVENT3 | 0100 | GIOA[3] |
| EVENT4 | 0101 | GIOA[4] |
| EVENT5 | 0110 | GIOA[5] |
| EVENT6 | 0111 | GIOA[6] |
| EVENT7 | 1000 | GIOA[7] |
| EVENT8 | 1001 | N2HET1[8] |

Table 7-34. MIBSPI5 Event Trigger Hookup (continued)

| | | |
|---------|------|---------------------|
| EVENT9 | 1010 | N2HET1[10] |
| EVENT10 | 1011 | N2HET1[12] |
| EVENT11 | 1100 | N2HET1[14] |
| EVENT12 | 1101 | N2HET1[16] |
| EVENT13 | 1110 | N2HET1[18] |
| EVENT14 | 1111 | Intern Tick counter |

NOTE

For N2HET1 trigger sources, the connection to the MibSPI5 module trigger input is made from the input side of the output buffer (at the N2HET1 module boundary). This way, a trigger condition can be generated even if the N2HET1 signal is not selected to be output on the pad.

NOTE

For GIOx trigger sources, the connection to the MibSPI5 module trigger input is made from the output side of the input buffer. This way, a trigger condition can be generated either by selecting the GIOx pin as an output pin + selecting the pin to be a GIOx pin, or by driving the GIOx pin from an external trigger source. If the mux control module is used to select different functionality instead of the GIOx signal, then care must be taken to disable GIOx from triggering MibSPI5 transfers; there is no multiplexing on the input connections.

7.11.4 MibSPI/SPI Master Mode I/O Timing Specifications

Table 7-35. SPI Master Mode External Timing Parameters (CLOCK PHASE = 0, SPICLK = output, SPISIMO = output, and SPISOMI = input)⁽¹⁾⁽²⁾⁽³⁾

| NO. | Parameter | | MIN | MAX | Unit | |
|------------------|----------------------|---|--|---|--|----|
| 1 | $t_{c(SPC)M}$ | Cycle time, SPICLK ⁽⁴⁾ | 40 | $256t_{c(VCLK)}$ | ns | |
| 2 ⁽⁵⁾ | $t_{w(SPCH)M}$ | Pulse duration, SPICLK high (clock polarity = 0) | $0.5t_{c(SPC)M} - t_{r(SPC)M} - 3$ | $0.5t_{c(SPC)M} + 3$ | ns | |
| | $t_{w(SPCL)M}$ | Pulse duration, SPICLK low (clock polarity = 1) | $0.5t_{c(SPC)M} - t_{f(SPC)M} - 3$ | $0.5t_{c(SPC)M} + 3$ | | |
| 3 ⁽⁵⁾ | $t_{w(SPCL)M}$ | Pulse duration, SPICLK low (clock polarity = 0) | $0.5t_{c(SPC)M} - t_{f(SPC)M} - 3$ | $0.5t_{c(SPC)M} + 3$ | ns | |
| | $t_{w(SPCH)M}$ | Pulse duration, SPICLK high (clock polarity = 1) | $0.5t_{c(SPC)M} - t_{r(SPC)M} - 3$ | $0.5t_{c(SPC)M} + 3$ | | |
| 4 ⁽⁵⁾ | $t_{d(SPCH-SIMO)M}$ | Delay time, SPISIMO valid before SPICLK low (clock polarity = 0) | $0.5t_{c(SPC)M} - 6$ | | ns | |
| | $t_{d(SPCL-SIMO)M}$ | Delay time, SPISIMO valid before SPICLK high (clock polarity = 1) | $0.5t_{c(SPC)M} - 6$ | | | |
| 5 ⁽⁵⁾ | $t_{v(SPCL-SIMO)M}$ | Valid time, SPISIMO data valid after SPICLK low (clock polarity = 0) | $0.5t_{c(SPC)M} - t_{f(SPC)} - 4$ | | ns | |
| | $t_{v(SPCH-SIMO)M}$ | Valid time, SPISIMO data valid after SPICLK high (clock polarity = 1) | $0.5t_{c(SPC)M} - t_{r(SPC)} - 4$ | | | |
| 6 ⁽⁵⁾ | $t_{su(SOMI-SPCL)M}$ | Setup time, SPISOMI before SPICLK low (clock polarity = 0) | $t_{f(SPC)} + 2.2$ | | ns | |
| | $t_{su(SOMI-SPCH)M}$ | Setup time, SPISOMI before SPICLK high (clock polarity = 1) | $t_{r(SPC)} + 2.2$ | | | |
| 7 ⁽⁵⁾ | $t_{h(SPCL-SOMI)M}$ | Hold time, SPISOMI data valid after SPICLK low (clock polarity = 0) | 10 | | ns | |
| | $t_{h(SPCH-SOMI)M}$ | Hold time, SPISOMI data valid after SPICLK high (clock polarity = 1) | 10 | | | |
| 8 ⁽⁶⁾ | $t_{C2TDELAY}$ | Setup time CS active until SPICLK high (clock polarity = 0) | CSHOLD = 0 | $C2TDELAY * t_{c(VCLK)} + 2 * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} - 7$ | $(C2TDELAY + 2) * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} + 5.5$ | ns |
| | | | CSHOLD = 1 | $C2TDELAY * t_{c(VCLK)} + 3 * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} - 7$ | $(C2TDELAY + 3) * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} + 5.5$ | |
| | $t_{C2TDELAY}$ | Setup time CS active until SPICLK low (clock polarity = 1) | CSHOLD = 0 | $C2TDELAY * t_{c(VCLK)} + 2 * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} - 7$ | $(C2TDELAY + 2) * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} + 5.5$ | ns |
| | | | CSHOLD = 1 | $C2TDELAY * t_{c(VCLK)} + 3 * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} - 7$ | $(C2TDELAY + 3) * t_{c(VCLK)} - t_{f(SPICS)} + t_{r(SPC)} + 5.5$ | |
| 9 ⁽⁶⁾ | $t_{T2CDELAY}$ | Hold time SPICLK low until CS inactive (clock polarity = 0) | $0.5 * t_{c(SPC)M} + T2CDELAY * t_{c(VCLK)} + t_{c(VCLK)} - t_{f(SPC)} + t_{r(SPICS)} - 7$ | $0.5 * t_{c(SPC)M} + T2CDELAY * t_{c(VCLK)} + t_{c(VCLK)} - t_{f(SPC)} + t_{r(SPICS)} + 11$ | ns | |
| | | Hold time SPICLK high until CS inactive (clock polarity = 1) | $0.5 * t_{c(SPC)M} + T2CDELAY * t_{c(VCLK)} + t_{c(VCLK)} - t_{r(SPC)} + t_{r(SPICS)} - 7$ | $0.5 * t_{c(SPC)M} + T2CDELAY * t_{c(VCLK)} + t_{c(VCLK)} - t_{r(SPC)} + t_{r(SPICS)} + 11$ | ns | |
| 10 | t_{SPIENA} | SPIENAn Sample point | $(C2TDELAY + 1) * t_{c(VCLK)} - t_{f(SPICS)} - 29$ | $(C2TDELAY + 1) * t_{c(VCLK)}$ | ns | |
| 11 | $t_{SPIENAW}$ | SPIENAn Sample point from write to buffer | | $(C2TDELAY + 2) * t_{c(VCLK)}$ | ns | |

(1) The MASTER bit (SPIGCR1.0) is set and the CLOCK PHASE bit (SPIFMTx.16) is cleared.

(2) $t_{c(VCLK)}$ = interface clock cycle time = $1 / f_{(VCLK)}$

(3) For rise and fall timings, see [Table 5-4](#).

(4) When the SPI is in Master mode, the following must be true:

For PS values from 1 to 255: $t_{c(SPC)M} \geq (PS + 1)t_{c(VCLK)} \geq 40ns$, where PS is the prescale value set in the SPIFMTx.[15:8] register bits.

For PS values of 0: $t_{c(SPC)M} = 2t_{c(VCLK)} \geq 40ns$.

The external load on the SPICLK pin must be less than 60pF.

(5) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPIFMTx.17).

(6) C2TDELAY and T2CDELAY is programmed in the SPIDELAY register

Figure 7-25. SPI Slave Mode Enable Timing (CLOCK PHASE = 1)

7.12 Ethernet Media Access Controller

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the device and the network. The EMAC supports both 10Base-T and 100Base-TX, or 10 Mbits/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QoS) support.

The EMAC controls the flow of packet data from the device to the PHY. The MDIO module controls PHY configuration and status monitoring.

Both the EMAC and the MDIO modules interface to the device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts.

7.12.1 Ethernet MII Electrical and Timing Specifications

Figure 7-26. MII Receive Timing

Table 7-39. MII Receive Timing

| Parameter | Description | MIN | MAX |
|---------------------|---|-----|-----|
| $t_{su}(GMIIMRXD)$ | Setup time, GMIIMRXD to GMIIMRCLK rising edge | 8ns | |
| $t_{su}(GMIIMRXDV)$ | Setup time, GMIIMRXDV to GMIIMRCLK rising edge | 8ns | |
| $t_{su}(GMIIMRXER)$ | Setup time, GMIIMRXER to GMIIMRCLK rising edge | 8ns | |
| $t_h(GMIIMRXD)$ | Hold time, GMIIMRXD valid after GMIIRCLK rising edge | 8ns | |
| $t_h(GMIIMRXDV)$ | Hold time, GMIIMRXDV valid after GMIIRCLK rising edge | 8ns | |
| $t_h(GMIIMRXER)$ | Hold time, GMIIMRXDV valid after GMIIRCLK rising edge | 8ns | |

Figure 7-27. MII Transmit Timing

Table 7-40. MII Transmit Timing

| Parameter | Description | MIN | MAX |
|-------------------------|--|-----|------|
| $t_d(\text{GMIIMTXD})$ | Delay time, GMIIMTCLK rising edge to GMIIMTXD | 5ns | 25ns |
| $t_d(\text{GMIIMTXEN})$ | Delay time, GMIIMTCLK rising edge to GMIIMTXEN | 5ns | 25ns |

7.12.2 Ethernet RMII Timing

Figure 7-28. RMII Timing Diagram

Table 7-41. RMII Timing Requirements

| NO. | Parameter | | Value | | | Unit |
|-----|-------------------|---|-------|-----|-----|------|
| | | | MIN | NOM | MAX | |
| 1 | tc(REFCLK) | Cycle time, RMII_REF_CLK | - | 20 | - | ns |
| 2 | tw(REFCLKH) | Pulse width, RMII_REF_CLK High | 7 | - | 13 | ns |
| 3 | tw(REFCLKL) | Pulse width, RMII_REF_CLK Low | 7 | - | 13 | ns |
| 6 | tsu(RXD-REFCLK) | Input setup time, RMII_RXD valid before RMII_REF_CLK High | 4 | - | - | ns |
| 7 | th(REFCLK-RXD) | Input hold time, RMII_RXD valid after RMII_REF_CLK High | 2 | - | - | ns |
| 8 | tsu(CRSDV-REFCLK) | Input setup time, RMII_CRSDV valid before RMII_REF_CLK High | 4 | - | - | ns |
| 9 | th(REFCLK-CRSDV) | Input hold time, RMII_CRSDV valid after RMII_REF_CLK High | 2 | - | - | ns |
| 10 | tsu(RXER-REFCLK) | Input setup time, RMII_RXER valid before RMII_REF_CLK High | 4 | - | - | ns |
| 11 | th(REFCLK-RXER) | Input hold time, RMII_RXER valid after RMII_REF_CLK High | 2 | - | - | ns |
| 4 | td(REFCLK-TXD) | Output delay time, RMII_REF_CLK High to RMII_TXD valid | 2 | - | 16 | ns |
| 5 | td(REFCLK-TXEN) | Output delay time, RMII_REF_CLK High to RMII_TX_EN valid | 2 | - | 16 | ns |

7.12.3 Management Data Input/Output (MDIO)

Figure 7-29. MDIO Input Timing

Table 7-42. MDIO Input Timing Requirements

| NO. | Parameter | | Value | | Unit |
|-----|------------------|---|-------------------|-----|------|
| | | | MIN | MAX | |
| 1 | tc(MDCLK) | Cycle time, MDCLK | 400 | - | ns |
| 2 | tw(MDCLK) | Pulse duration, MDCLK high/low | 180 | - | ns |
| 3 | tt(MDCLK) | Transition time, MDCLK | - | 5 | ns |
| 4 | tsu(MDIO-MDCLKH) | Setup time, MDIO data input valid before MDCLK High | 12 ⁽¹⁾ | - | ns |
| 5 | th(MDCLKH-MDIO) | Hold time, MDIO data input valid after MDCLK High | 1 | - | ns |

(1) This is a discrepancy to IEEE 802.3, but is compatible with many PHY devices.

Figure 7-30. MDIO Output Timing

Table 7-43. MDIO Output Timing Requirements

| NO. | Parameter | | Value | | Unit |
|-----|-----------------|---|-------|-----|------|
| | | | MIN | MAX | |
| 1 | tc(MDCLK) | Cycle time, MDCLK | 400 | - | ns |
| 7 | td(MDCLKL-MDIO) | Delay time, MDCLK low to MDIO data output valid | 0 | 100 | ns |

8 Applications, Implementation, and Layout

NOTE

Information in the following sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 TI Design or Reference Design

TI Designs Reference Design Library is a robust reference design library spanning analog, embedded processor, and connectivity. Created by TI experts to help you jump start your system design, all TI Designs include schematic or block diagrams, BOMs, and design files to speed your time to market. Search and download designs at [TIDesigns](#).

9 Device and Documentation Support

9.1 Device Support

9.1.1 Development Support

Texas Instruments (TI) offers an extensive line of development tools for the Hercules™ Safety generation of MCUs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of Hercules™-based applications:

Software Development Tools

- Code Composer Studio™ Integrated Development Environment (IDE)
 - C/C++ Compiler
 - Code generation tools
 - Assembler/Linker
 - Cycle Accurate Simulator
- Application algorithms
- Sample applications code

Hardware Development Tools

- Development and evaluation boards
- JTAG-based emulators - XDS100 v2, XDS200, XDS560™ v2 emulator
- Flash programming tools
- Power supply
- Documentation and cables

9.1.2 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all devices. Each device has one of three prefixes: X, P, or null (no prefix) (for example, xRM46L852). These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices/tools.

Device development evolutionary flow:

- | | |
|-------------|--|
| x | Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow. |
| P | Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications. |
| null | Fully-qualified production device. |

x and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

Figure 9-1 shows the numbering and symbol nomenclature for the RM57L843.

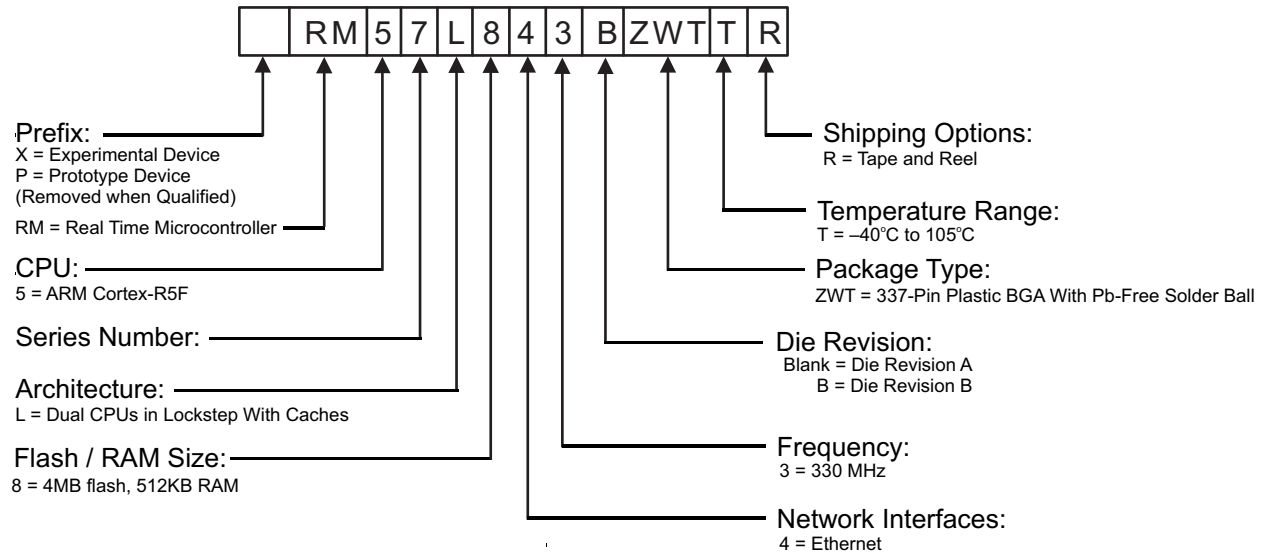

Figure 9-1. RM57L843 Device Numbering Conventions

9.2 Documentation Support

9.2.1 Related Documentation from Texas Instruments

The following documents describe the *RM57L843* microcontroller..

SPNU562 *RM57x 16/32-Bit RISC Flash Microcontroller Technical Reference Manual* details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device.

SPNZ214 *RM57x Microcontroller, Silicon Revision A, Silicon Errata* describes the usage notes and known exceptions to the functional specifications for the device silicon revision(s).

SPNZ233 *RM57x Microcontroller, Silicon Revision B, Silicon Errata* describes the usage notes and known exceptions to the functional specifications for the device silicon revision(s).

9.2.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.2.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

TI Embedded Processors Wiki *Texas Instruments Embedded Processors Wiki*. Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

9.3 Trademarks

Hercules, Code Composer Studio, XDS560, E2E are trademarks of Texas Instruments.

ETM is a trademark of ARM Limited.

ARM, Cortex are registered trademarks of ARM Limited (or its subsidiaries) in the EU and/or elsewhere.

All rights reserved.

CoreSight is a trademark of ARM Limited (or its subsidiaries) in the EU and/or elsewhere. All rights reserved..

All other trademarks are the property of their respective owners.

9.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.5 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

9.6 Device Identification

9.6.1 Device Identification Code Register

The device identification code register is memory mapped to address FFFF FFF0h and identifies several aspects of the device including the silicon version. The details of the device identification code register are provided in [Table 9-1](#). The device identification code register value for this device is:

- Rev A = 0x8044AD05
- Rev B = 0x8044AD0D

| | | | | | | | | | | | | | | | |
|-------|------------------|-------------|----|---------------|-----------|---------|---------|----|----|----|----|----|-----|-----|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 9-2. Device ID Bit Allocation Register

Table 9-1. Device ID Bit Allocation Register Field Descriptions

| Bit | Field | Value | Description |
|-------|-------------------|--------|---|
| 31 | CP15 | 1 | Indicates the presence of coprocessor 15 CP15 present |
| 30-17 | UNIQUE ID | 100011 | Silicon version (revision) bits. This bitfield holds a unique number for a dedicated device configuration (die). |
| 16-13 | TECH | 0101 | Process technology on which the device is manufactured. F021 |
| 12 | I/O VOLTAGE | 0 | I/O voltage of the device. I/O are 3.3v |
| 11 | PERIPHERAL PARITY | 1 | Peripheral Parity Parity on peripheral memories |
| 10-9 | FLASH ECC | 10 | Flash ECC Program memory with ECC |
| 8 | RAM ECC | 1 | Indicates if RAM ECC is present. ECC implemented |
| 7-3 | REVISION | | Revision of the Device. |
| 2-0 | 101 | | The platform family ID is always 0b101 |

9.6.2 Die Identification Registers

The two die ID registers at addresses 0xFFFFF7C and 0xFFFFF80 form a 64-bit die id with the information as listed in [Table 9-2](#).

Table 9-2. Die-ID Registers

| Item | # of Bits | Bit Location |
|-------------------|-----------|------------------|
| X Coord. on Wafer | 12 | 0xFFFFF7C[11:0] |
| Y Coord. on Wafer | 12 | 0xFFFFF7C[23:12] |
| Wafer # | 8 | 0xFFFFF7C[31:24] |
| Lot # | 24 | 0xFFFFF80[23:0] |
| Reserved | 8 | 0xFFFFF80[31:24] |

9.7 Module Certifications

10 Mechanical Data

10.1 Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-------------------------|-------------------------|----------------------|--------------|-------------------------|----------------|
| RM57L843BZWTT | ACTIVE | NFBGA | ZWT | 337 | 90 | Green (RoHS & no Sb/Br) | SNAGCU | Level-3-260C-168 HR | -40 to 105 | RM57 L843BZWTT | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZWT (S-PBGA-N337)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. This is a Pb-free solder ball design.
 - D. Falls within JEDEC MO-275.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
