

# THE DATASHEET OF PLED13SW

PLEDxSW Series - White Body

**OBSOLETE** DATE: 03/26/2020 PCN/ECN# 41325  
REPLACED BY: PLED series

**Description**

PLEDxSW Series open LED protectors provide a switching electronic shunt path when an LED in an LED string fails as an open circuit. This ensures that the remaining string of LEDs will continue to function if a single LED does not.

PLEDxSW Series devices were designed to enable higher reliability in indoor LED lighting applications such as advertisement lighting and other applications. Additionally, they are molded from white material to make them less visible in the LED fixture and the white molding also reflects more light to improve overall light engine efficiency.

Compatible with one, two and three watt LEDs that have a nominal 3V forward characteristic, PLEDxSW Series devices are available in SMB surface mount package. The DO-214AA (SMB) low profile package is ideal for dense board applications.

### LED Interference Test Circuit

**6 LEDs in Series 50% Duty Cycle 10kHz**

**5 LEDs and 1 PLED in Series 50% Duty Cycle 10kHz**

Note: These two graphs show the current magnitude through the LED string with and without the PLED included. There is no noticeable effect on the LED current magnitude when the PLED is included in the circuit as compared to the LED current magnitude when the PLED is not in the circuit. (The conversion factor for the test measurement in the graphs above is 10mA/mV for the Pearson coil measurement, therefore, the current magnitude in the first figure is 10mA\*8.9 = 89mA, while the second figure is 91mA.)

**PLED in the Off-State 10kHz**

Channel 1: current through LEDs (318 mA)  
Channel 2: voltage across PLED device (4.5 V)

**PLED device zeners and then turns fully on 10kHz**

Channel 1: current through LEDs (346 mA) and PLED device once it is fully turned on 2.5 µsec later  
Channel 2: voltage across PLED device (21.3 V before PLED crowbars with 2V drop)
