

**THE DATASHEET OF
ICL7641BCWE**

ICL761X–ICL764X

Single/Dual/Triple/Quad Operational Amplifiers

General Description

The ICL761X–ICL764X family of monolithic CMOS op amps combine ultra-low input current with low-power operation over a wide supply voltage range. With pin-selectable quiescent currents of 10µA, 100µA, or 1000µA per amplifier, these op amps will operate from ±1V to ±8V power supplies, or from single supplies from 2V to 16V. The CMOS outputs swing to within milli-volts of the supply voltages.

The ultra-low bias current of 1pA makes this family of op amps ideal for long time constant integrators, picoammeters, low droop rate sample/hold amplifiers and other applications where input bias and offset currents are critical. A low noise current of $0.01\text{pA}\sqrt{\text{Hz}}$ and an input impedance of $10^{12}\Omega$ ensure optimum performance with very high source impedances in such applications as pH meters and photodiode amplifiers.

Applications

- Battery-Powered Instruments
- Low-Leakage Amplifiers
- Long-Time Constant Integrators
- Low-Frequency Active Filters
- Hearing Aids and Microphone Amplifiers
- Low Droop Rate Sample/Hold Amplifiers
- Picoammeters

Pin Configuration

Features

- Pin-for-Pin Second Source
- 1pA Typical Bias Current—4nA (max) at +125°C
- ±1V to ±8V Wide Supply Voltage Range
- Industry-Standard Pinouts
- Programmable Quiescent Currents of 10µA, 100µA, and 1000µA
- Monolithic, Low-Power CMOS Design

Ordering Information

ICL76XX	M	N	OP
	V _{OS} SELECTION	TEMP RANGE	PKG CODE
	A = 2mV	C = 0°C to 70°C	TV= 8-Pin TO-99
	B = 5mV	E = -40°C to +85°C	PA = 8-Pin Plastic Dip
	C = 10mV	M = -55°C to +125°C	SA = 8-Pin Small SO
	D = 15mV		JD = 14-Pin Cerdip
	E = 20mV		PD = 14-Pin Plastic Dip
			SD = 14-Pin Small SO
			JE = 16-Pin Cerdip
			PE = 16-Pin Plastic Dip
			SE = 16-Pin Small SO
			WE = 16-Pin Wide SO

Typical Operating Circuit appears at end of data sheet.

Pin Configurations

Absolute Maximum Ratings (Single/Dual)

Total Supply Voltage (V+ to V-)+18V
 Input Voltage(V+ + 0.3V) to (V- - 0.3V)
 Differential Input Voltage (Note 1)±(V+ + 0.3V) to (V- - 0.3V)
 Duration of Output Short Circuit (Note 2) Unlimited
 Continuous Power Dissipation (T_A = +25°C)
 TO-99 Metal Can (derate 2mW/°C above +25°C)250mW
 8-Pin Minidip (derate 2mW/°C above +25°C)250mW
 14-Pin Plastic (derate 3mW/°C above +25°C)375mW
 14-Pin CERDIP (derate 4mW/°C above +25°C)500mW
 16-Pin Plastic (derate 3mW/°C above +25°C)375mW
 16-Pin CERDIP (derate 4mW/°C above +25°C)500mW

Operating Temperature Ranges:
 M Series -55°C to +125°C
 E Series -40°C to +85°C
 C Series -0°C to +70°C
 Storage Temperature Range -55°C to +150°C
 Lead Temperature (soldering, 10s) +300°C
 Soldering Temperature (reflow)
 Lead(Pb)-Free Packages +260°C
 Packages Containing Lead +240°C

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: Long-term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.

Note 2: The outputs may be shorted to ground or to either supply for V_{SUPP} ≤ 10V. Care must be taken to insure that the dissipation rating is not exceeded.

Electrical Characteristics (Single/Dual)

(V_{SUPP} = ±1.0V, I_Q = 10µA, T_A = +25°C, unless otherwise noted.)

14-Pin Plastic (derate 3mW/°C above +25°C)375mW	Lead Temperature (soldering, 10s) +300°C
14-Pin CERDIP (derate 4mW/°C above +25°C)500mW		

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 5: Long-term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.

Note 6: The outputs may be shorted to ground or to either supply for V_{SUPP} ≤ 10V. Care must be taken to insure that the dissipation rating is not exceeded.

Electrical Characteristics (Triple/Quad)

Detailed Description

Quiescent Current Selection

The voltage input to the I_Q pin of the single and triple amplifiers selects a quiescent current (I_Q) of 10 μ A, 100 μ A, or 1000 μ A. The dual and quad amplifiers have fixed quiescent current (I_Q) settings. Unity-gain bandwidth and slew-rate increase with increasing quiescent current, as does output sink current capability. The output source current capability is independent of quiescent current.

The lowest I_Q setting that results in sufficient bandwidth and slew rate should be selected for each specific application.

The I_Q pin of the single and triple amplifiers controls the quiescent current as follows:

$I_Q = 10\mu\text{A}$	I_Q pin to V+
$I_Q = 100\mu\text{A}$	I_Q pin between V- + 0.8V and V+ - 0.8V
$I_Q = 1\text{mA}$	I_Q pin to V

Input Offset Nulling

The input offset can be nulled by connecting a 25k Ω pot between the OFFSET terminals with the wiper connected to V+. At quiescent currents of 1mA and 100 μ A, the nulling range provided is adequate for all V_{OS} selections. However, with higher values of V_{OS} , and an I_Q of 10 μ A, nulling may not be possible.

Frequency Compensation

All of the ICL7611 and ICL7621 series except the ICL7614 are internally compensated for unity-gain operation. The ICL7614 is externally compensated by a capacitor connected between COMP and OUT pins, with 39pF being greater than unity. The compensation capacitor value may be reduced to increase the bandwidth and slew rate. The ICL7132 is not compensated and does not have frequency compensation pins. Use only at gains 20 at I_Q of 1mA; at gains > 10 at I_Q of 100 μ A; at gain > 5 at I_Q of 10 μ A.

Output Loading Considerations

Approximately 70% of the amplifier's quiescent current flows in the output stage. The output swing can approach the supply rails for output loads of 1M Ω , 100k Ω , and 10k Ω , using the output stage in a highly linear Class A mode. Crossover distortion is avoided and the voltage gain is maximized in this mode. The output

stage, however, can also be operated in Class AB, which supplies higher output currents (see the *Typical Operating Characteristics*). The voltage gain decreases and the output transfer characteristic is non-linear during the transition from Class A to Class B operation.

The output stage, with a gain that is directly proportional to load impedance, approximates a transconductance amplifier. Approximately the same open-loop gains are obtained at each of the I_Q settings if corresponding loads of 10k Ω , 100k Ω , and 1M Ω are used.

The maximum output source current is higher than the maximum sink current, and is independent of I_Q .

Like most amplifiers, there are output loads for which the amplifier stability is not guaranteed. In particular, avoid capacitive loads greater than 100pF; and while on the 1mA I_Q setting, avoid loads less than 5k Ω . Since the output stage is a transconductance output, very large (>10 μ F) capacitive loads will create a dominant pole and the output will be stable, even with loads that are less than 5k Ω .

Extended Common-Mode Voltage Range (ICL7612/ICL7616)

A common-mode voltage range that includes both V+ and V- is often desirable, especially in single-supply operation. The ICL7612/ICL7616 extended common-mode range op amps are designed specifically to meet this need. The ICL7612 input common-mode voltage range (CMVR) extends beyond both power-supply rails when operated with at least 3V total supply and an I_Q of 10 μ A or 100 μ A. The ICL7616 CMVR includes the negative supply voltage (or ground when operated with a single supply) at an I_Q of 10 μ A or 100 μ A.

PC Board Layout

Careful PC board layout techniques must be used to take full advantage of the very low bias current of the ICL7611 family. The inputs should be encircled with a low-impedance trace, or guard, that is at the same potential as the inputs. In an inverting amplifier, this is normally ground; in a unity-gain buffer connect the guard to the output. A convenient way of guarding the 8-pin TO-99 version of the ICL7611 is to use a 10-pin circle, with the two extra pads on either side of the input pins to provide space for a guard ring (see Figure 8). Assembled boards should be carefully cleaned, and if a high humidity environment is expected, conformally coated.

Single-Supply Operation

The ICL7611 family will operate from a single 2V to 16V power supply. The common-mode voltage range of the standard amplifier types when operated from a single supply is 1.0V to (V+ - 0.6V) at 10µA I_Q. At 100µA I_Q, the CMVR is 1.0V to (V+ - 0.8V), and at 1mA I_Q, the CMVR is 1.3V to (V+ - 1.3V). If this CMVR range is insufficient, use the ICL7612, whose CMVR includes both ground and V+, or the ICL7616, whose CMVR includes ground.

A convenient way to generate a psuedo-ground at V+/2 is to use one op amp of a quad to buffer a V+/2 voltage from a high-impedance resistive divider.

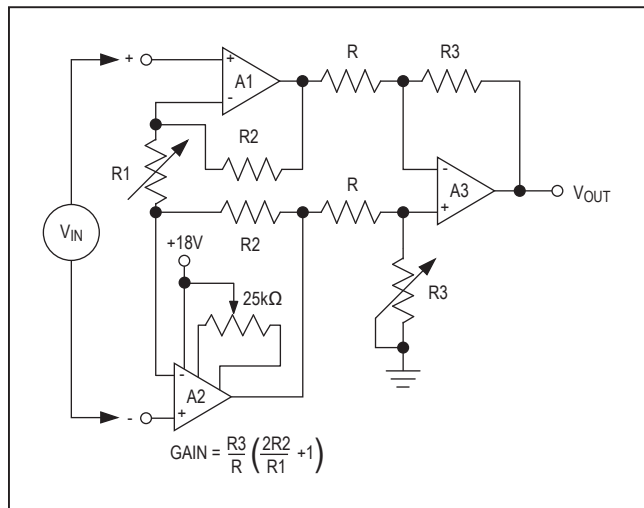

Figure 1. Instrumentation Amplifier—Adjust R3 to improve CMRR. The offset of all three amplifiers is nulled by the offset adjustment of A2.

Low-Voltage Operation

Operation at V_{SUPP} = ±1.0V is only guaranteed at I_Q = 10µA. Output swings to within a few millivolts of the supply rails are achievable for R_L (> or =) 1MΩ. Guaranteed input CMVR is ±0.6V minimum and typically +0.9V to -0.7V at V_{SUPP} = ±1.0V. For applications where greater common-mode range is desirable, see the description of ICL7612 and ICL7616 above.

Applications Information

Note that in no case is I_Q shown. The value of I_Q must be chosen by the designer with regard to frequency response and power dissipation.

Figure 2. Simple Follower—By using the ICL7612 in these applications, the circuits will follow rail-to-rail inputs

Figure 3. Level Detector—By using the ICL7612 in these applications, the circuits will follow rail-to-rail inputs.

Figure 4. Photocurrent Integrator—Low-leakage currents allow integration times up to several hours.

Figure 5. Precise Triangle/Square Wave Generator—The frequency and duty cycle are virtually independent of power supply.

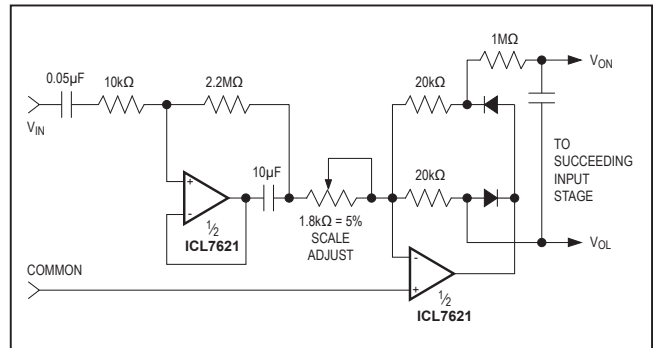

Figure 6. Averaging AC to DC Converter—Recommended for Maxim's ICL7106/ICL7107/ICL7109 A/D Converters.

Figure 7. Burn-In and Life Test Circuit

Figure 8. Input Guard for TO-99

Figure 9. Low Droop Rate Sample and Hold—S2 improves accuracy and acquisition time by including the voltage drop across S1 inside the feedback loop of A1 during the hold phase. R1 closes the feedback loop of A1 during the hold phase. The droop rate is $[I_{BIAS(AZ)} + I_{LEAK(S1)} + I_{LEAK(S2)}]/C_{HOLD}$.

Figure 10. Long-Time Constant Integrator—With $R_{IN} = 1011\Omega$, the time constant of this integrator is 100,000s. Since the input voltage is converted to a current by R_{IN} , the input voltage can far exceed the power-supply range.

Figure 11. Pico Ammeter—The response time of this circuit is $R_{FB} \times C_{FB}$, where C_{FB} is the stray capacitance between the output and the inverting terminal of the amplifier.

Figure 12. 60Hz Twin “T” Notch Filter—The low 1pA bias current of the ICL7611 allows use of small 540pF and 270pF capacitors, even with a notch frequency of 60Hz. The 60Hz rejection is approximately 40dB.
