

**THE DATASHEET OF
9FG108EFLFT**

Description

The ICS9FG108E is a Frequency Generator that provides 8 differential HCSL output pairs. It can be used to drive PCIe Gen1/2, SATA and USB3.0 devices. The part can use either a 14.31818 Mhz or 25 MHz crystal. The ICS9FG108E can also be driven by a reference input clock instead of a crystal. It provides outputs with cycle-to-cycle jitter of less than 50 ps and output-to-output skew of less than 65 ps.

Recommended Application

Frequency Generator for CPU, PCIe Gen1/2, SATA and USB3.0

Output Features

- 8 - HCSL differential outputs
- 1 - 3.3V REF output (either 14.318M or 25M depending on XTAL)

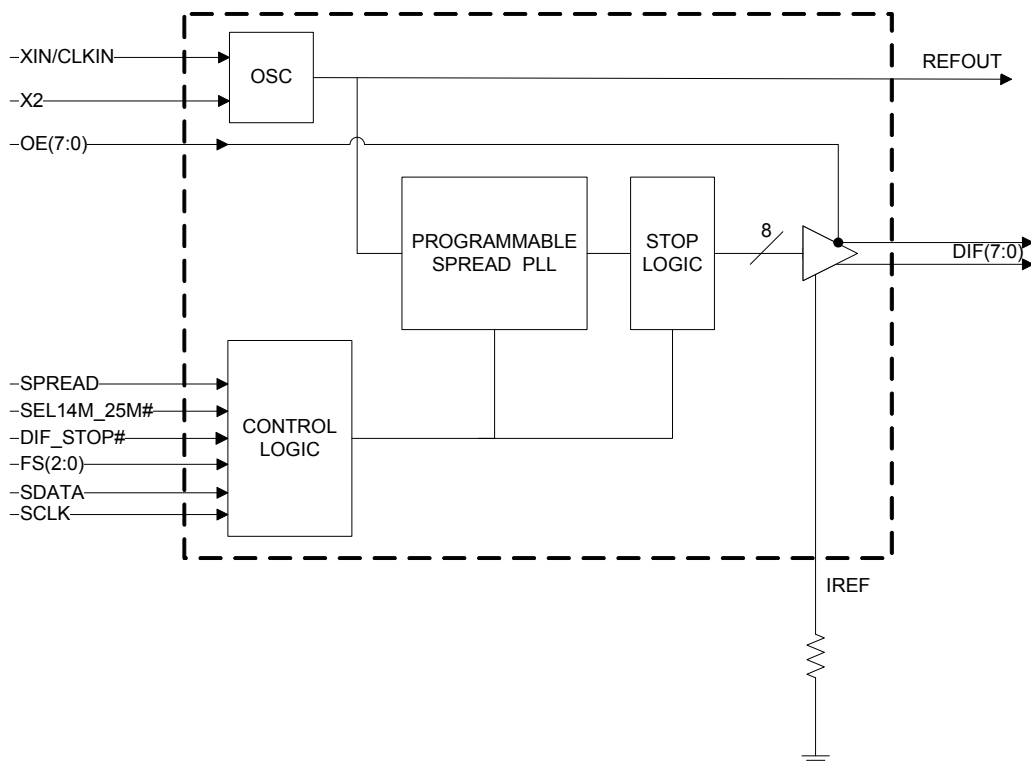

Features/Benefits

- Generates common frequencies from 14.318MHz or 25MHz
- Crystal or reference input
- 8 - 0.7V current-mode HCSL output pairs
- Supports Serial-ATA at 100MHz
- Two spread spectrum modes: -0.5% down spread and +/-0.25% center spread; Lower EMI
- 31.5KHz spread modulation rate; passes USB3 compliance testing
- Unused outputs may be disabled in either driven or Hi-Z state for power management
- I-temp version available; supports embedded applications

Key Specifications

- Cycle to cycle jitter: < 50ps
- Phase jitter: PCIe Gen1/2 <3ps rms
- Output to output skew <65ps
- +/-300 ppm frequency accuracy on output clocks
- +/-50ppm on all output frequencies with Spread Off

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS9FG108E. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

³ Input frequency should be measured at the REF pin and tuned to 0 PPM to meet ppm frequency accuracy on PLL outputs.

⁴ These values assume 25MHz or 14.31818MHz inputs respectively. Using a higher or lower frequency will scale these frequencies accordingly. The output frequency selected by the FS inputs will also scale. For example, 27MHz input with an FS selection of 100MHz will yield an output frequency of $27/25 \times 100 = 108\text{MHz}$.

DIF_STOP# - Assertion (transition from '1' to '0')

Asserting DIF_STOP# pin stops all DIF outputs that are set to be stoppable after their next transition. When the SMBus DIF_STOP tri-state bit corresponding to the DIF output of interest is programmed to a '0', DIF output will stop DIF_True = HIGH and DIF_Complement = LOW. When the SMBus DIF_STOP tri-state bit corresponding to the DIF output of interest is programmed to a '1', DIF outputs will be tri-stated.

**DIF_STOP# - De-assertion (transition from '0' to '1')**

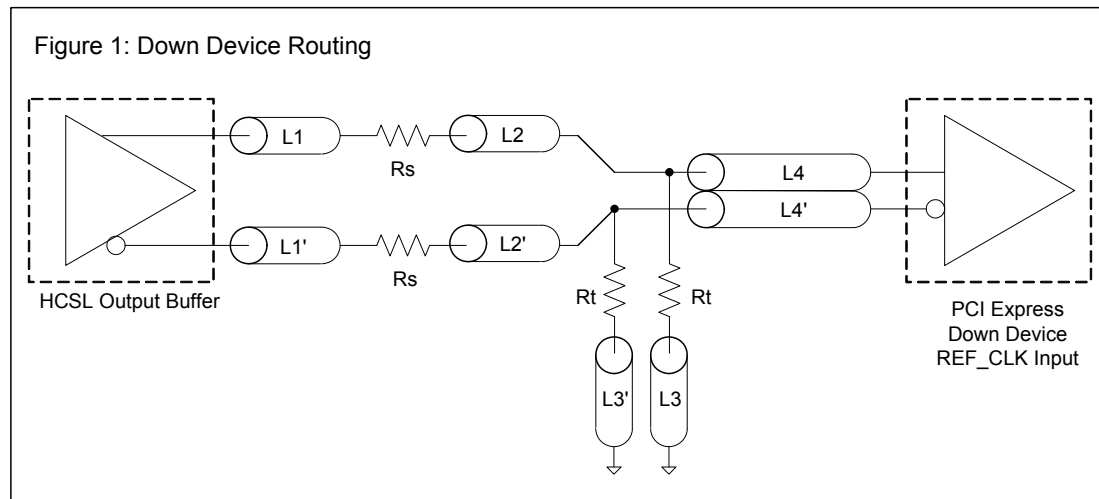

With the de-assertion of DIF_STOP# all stopped DIF outputs will resume without a glitch. The maximum latency from the de-assertion to active outputs is 2 - 6 DIF clock periods. If the control register tristate bit corresponding to the output of interest is programmed to '1', then the stopped DIF outputs will be driven High within 15nS of DIF_Stop# de-assertion to a voltage greater than 200mV.

Revision History

Rev.	Issue Date	Issuer	Description	Page #
A	6/21/2012	RDW	Moved from Advance to Final	
B	10/11/2012	RDW	Harmonized the Electrical Tables with the 9FG104E	
C	10/29/2012	AT	Update the Jitter parameters in the table "Electrical Characteristics – REF 14.318/25MHz" to distinguish between commercial and industrial conditions. Added a separate line for each condition. For commercial, values were changed from 87ps Min & 250ps Max to 87ps Min & 200ps Max. For industrial, values are kept the same – 87ps Min & 250ps Max.	5
