

**3V LVDS High-Speed
Differential Line Receivers**

Features

- Signaling Rates >400Mbps (200 MHz)
- Single 3.3V Power Supply Design
- Accepts $\pm 350\text{mV}$ (typical) Differential Swing
- Maximum Differential Skew of 0.35ns
- Maximum Propagation Delay of 3.3ns
- Low Voltage TTL (LVTTTL) Outputs
- Industrial Temperature Operating Range: -40°C to 85°C
- Open, Short, and Terminated Fail Safe
- Meets or Exceeds IEEE 1596.3 SCI Standard
- Meets or Exceeds ANSI/TIA/EIA-644 LVDS Standard
- Packaging (Pb-free & Green available):
- SOIC, TSSOP, and MSOP

Description

The PI90LV032A, PI90LV028A, and PI90LV018A are differential line receivers that use low-voltage differential signaling (LVDS) to support data rates in excess of 400 Mbps. These products are designed for applications requiring high-speed, low-power consumption and low noise generation.

A differential input signal (350mV) is translated by the device to 3V CMOS output level. Exclusive to the PI90LV032A quad receiver is a power-down mode that Three-states the outputs and places the device in a low-power idle state (40mW typical).

Applications

Applications include point-to-point and multidrop baseband data transmission over controlled impedance media of approximately 100 Ohms. The transmission media can be printed circuit board traces, backplanes, or cables.

The PI90LV032A, PI90LV028A, PI90LV018A and companion line drivers (PI90LV031A, PI90LV027A, and PI90LV017A) provide new alternatives to RS-232, PECL, and ECL devices for high-speed, point-to-point interface applications.

Absolute Maximum Ratings (see Note 1, Page 4)

Supply Voltage (V _{CC})	-0.3V to +4.0V
Input Voltage (R _{IN+} , R _{IN-})	-0.3V to +3.9V
Enable Input Voltage (EN, EN*)	-0.3V to (V _{CC} +0.3V)
Output Voltage (R _{OUT})	-0.3V to (V _{CC} +0.3V)
S Package	750mW
Derate S Package	8.2mW/°C above +25°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature Range Soldering (4s)	+260°C
Maximum Junction Temperature	+150°C
ESD Rating	≥6kV

Note:

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

- “Absolute Maximum Ratings” are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of “Electrical Characteristics” specifies conditions of device operation.
- Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground unless otherwise specified.
- All typicals are given for: $V_{CC} = +3.3V$, $T_A = +25^\circ C$.
- Generator waveform for all tests unless otherwise specified: $f = 1 MHz$, $Z_O = 50\Omega$, t_R and t_F (0% to 100%) $\leq 3ns$ for R_{IN} .
- The V_{CMR} range is reduced for larger V_{ID} . Example : if $V_{ID} = 400mV$, the V_{CMR} is 0.2V to 2.2V. The fail-safe condition with inputs shorted is valid over a common-mode range of 0V to 2.3V. A V_{ID} up to $V_{CC} - 0V$ may be applied to the R_{IN+} / R_{IN-} inputs with the Common-Mode voltage set to $V_{CC}/2$. Propagation delay and Differential Pulse skew decrease when V_{ID} is increased from 200mV to 400mV. Skew specifications apply for $200mV \leq V_{ID} \leq 800mV$ over the common mode range.
- tskd1 is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.
- tSKD2, Channel-to-Channel Skew, is defined as the difference between the propagation delay of one channel and that of the others on the same chip with any event on the inputs.
- tSKD3, Part-to-Part Skew, is the differential Channel-to-Channel skew of any event between devices. This specification applies to devices at the same V_{CC} , and within $5^\circ C$ of each other within the operating temperature range.
- tSKD4, Part-to-Part Skew, is the differential Channel-to-Channel skew of any event between devices. This specification applies to devices over recommended operating temperature and voltage ranges, and across process distribution. tskd4 is defined as $I_{Max} - Mini$ differential propagation delay.
- Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only. Only one output should be shorted at a time, do not exceed maximum junction temperature specification.
- C_L includes probe and jig capacitance.
- V_{CC} is always higher than R_{IN+} and R_{IN-} voltage. R_{IN-} and R_{IN+} are allowed to have a voltage range -0.2V to $V_{CC} - V_{ID}/2$. However, to be compliant with AC specifications, the common voltage range 0.1V to 2.3V.
- fmax generator input conditions: $t_R = t_F < 1ns$, (0% to 100%), 50% duty cycle, differential (1.05V to 1.35V peak to peak). Output Criteria: duty cycle = 60%/40%, V_{OL} (max 0.4V), V_{OH} (min 2.7V), Load = 10pF (stray plus probes).
