

**THE DATASHEET OF
ADR827BRMZ-REEL7**

FEATURES

10-lead MSOP
400 μ A supply current
 -40°C to $+125^{\circ}\text{C}$ temperature range
On-board precision resistors
Reference

ADR821: 2.8 V to 15 V operation
ADR827: 2.7 V to 15 V operation
 $\pm 0.2\%$ initial accuracy
15 ppm/ $^{\circ}\text{C}$ temperature drift maximum
 $+5\text{ mA}/-3\text{ mA}$ output drive

Amplifier

ADR821
 $\pm 2.8\text{ V}$ to $\pm 15\text{ V}$ operation
2.8 V to 15 V single-supply operation
ADR827
 $\pm 2.7\text{ V}$ to $\pm 15\text{ V}$ operation
2.7 V to 15 V single-supply operation
Rail-to-rail input and output
500 μ V offset voltage maximum
50 nA bias current maximum
Unity gain stable
No phase reversal

APPLICATIONS

Battery-powered instrumentation
Portable medical instrumentation
Data acquisition systems
Industrial process controls
Automotive applications

GENERAL DESCRIPTION

The ADR821/ADR827 combines a precision voltage reference and an op amp in a 10-lead mini small outline package (MSOP). The reference and the op amp can be operated independently, offering the user a range of flexibility when arranging the combination. Featuring a combined operating current of less than 400 μ A and 15 ppm/ $^{\circ}\text{C}$ temperature drift on the reference, the ADR821/ADR827 are ideally suited for applications requiring precision and low power.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

Table 1. Selection Table

Part No.	Reference V_{OUT}	Reference Accuracy	Reference Temperature Coefficient
ADR827ARMZ	1.25 V	$\pm 0.4\%$	30 ppm/ $^{\circ}\text{C}$
ADR827BRMZ	1.25 V	$\pm 0.2\%$	15 ppm/ $^{\circ}\text{C}$
ADR821ARMZ	2.50 V	$\pm 0.4\%$	30 ppm/ $^{\circ}\text{C}$
ADR821BRMZ	2.50 V	$\pm 0.2\%$	15 ppm/ $^{\circ}\text{C}$

Available with the reference at 1.25 V and at 2.5 V, the ADR821/ADR827 also come in two grades. The reference on the A grade offers 30 ppm/ $^{\circ}\text{C}$ temperature drift performance and $\pm 0.4\%$ initial accuracy. The B grade provides a tighter temperature drift performance of 15 ppm/ $^{\circ}\text{C}$ and only $\pm 0.2\%$ initial accuracy. All versions operate from -40°C to $+125^{\circ}\text{C}$.

ABSOLUTE MAXIMUM RATINGS

T_A= 25°C, unless otherwise noted.

Table 8.

Parameter	Rating
Supply Voltage	±18 V
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	-65°C to +125°C
Operating Temperature Range	-40°C to +125°C
Junction Temperature Range	-65°C to +125°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, θ_{JA} is specified for device soldered in circuit board for surface-mount packages.

Table 9. Thermal Resistance

Package Type	θ _{JA}	θ _{JC}	Unit
10-Lead MSOP (RM-10)	172	50	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

ADR821/ADR827

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 10. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	V+	Input Voltage of the Reference/Positive Supply of the Amplifier
2	R ₁	Resistance Tied to Positive Input of the Amplifier
3	GND	Ground
4	NC	Do Not Connect Any External Components to This Pin
5	V-	Negative Supply of the Amplifier
6	REF_OUT	Output Voltage of the Reference
7	+IN	Positive Input of the Amplifier
8	-IN	Negative Input of the Amplifier
9	R ₂	Resistance Tied to Positive Input of the Amplifier
10	AMP_OUT	Output Pin of the Amplifier

APPLICATIONS INFORMATION

+2.5 V AND -2.5 V OUTPUTS (ADR821)

Figure 38. +2.5 V and -2.5 V Outputs

In many dual-supply applications, it is desirable to have ± 2.5 V references. Using the configuration shown in Figure 38, it is possible to generate -2.5 V with the help of a $+2.5$ V reference, an internal op amp, and 10 k Ω resistors. The supply voltages $V+$ and $V-$ should be greater than $+2.8$ V and -2.8 V, respectively. The op amp is configured as an inverting amplifier with a gain of -1 , which produces -2.5 V at the output of the op amp. The output of the reference is fed to the amplifier inverting input. Because the op amp has very low input offset voltage (500 μ V over the full temperature range) and the TC ratio of the resistors is typically ± 25 ppm/ $^{\circ}$ C, the -2.5 V output is less than 7 mV away from the theoretical value.

2.5 V AND 5.0 V OUTPUTS (ADR821)

Figure 39. 2.5 V and 5.0 V Outputs

In many single-supply applications, it is desirable to have multiple reference voltages. Using the configuration shown in Figure 39, it is possible to generate 5.0 V with the help of a 2.5 V reference, an internal op amp, and resistors. $V+$ should be kept at greater than 5.8 V and $V-$ can be connected either to ground or to negative supply. The output of the reference is

fed to the amplifier noninverting input. The op amp is configured as a noninverting amplifier with a gain of $+2$, which produces 5 V at the output of the op amp. Using the guaranteed maximum offset voltage over the temperature, and the typical TC ratio of the resistors over the full temperature range, the output is within 15 mV of the calculated value.

MULTIPLE 2.5 V OUTPUTS (ADR821)

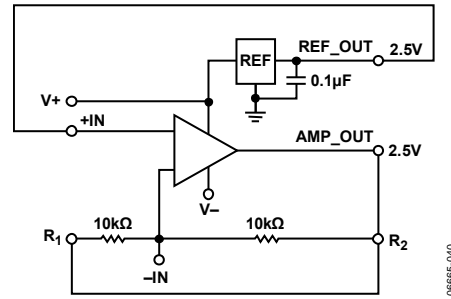

Figure 40. Multiple 2.5 V Outputs

On some boards, sensitive analog circuits, such as a VCO, exist with noisy digital circuits. If the supply current requirements are low (less than 3 mA), series references and op amps can be used. Using the configuration shown in Figure 40, two different 2.5 V supplies can be created using a single ADR821. The supply voltage $V+$ should be greater than 2.8 V and $V-$ can be connected to ground or a negative voltage. The op amp is configured as a voltage follower with a gain of $+1$, which produces 2.5 V at the output of the op amp. The output of the reference is fed to the amplifier noninverting input. Because the op amp has very low input offset voltage (500 μ V maximum over the full temperature range), the output voltage from the op amp section tracks the reference voltage within 1 mV. For a dynamic load, such as the reference input pin on some analog-to-digital converters, the load should be connected to an op amp output and the noise sensitive circuitry, such as a VCO, should be connected to the reference voltage. If the dynamic load is connected to the reference voltage, any perturbations appear as a signal to the input of the voltage follower and appear on the other output.

OUTLINE DIMENSIONS

COMPLIANT TO JEDEC STANDARDS MO-187-BA
