CMOS Analog Switches

DG304(A)/DG305(A)/DG306(A)/DG307(A)

General Description

Maxim's DG304-DG307 and DG304A-DG307A CMOS dual and quad analog switches combine low power operation with fast switching times and superior DC and AC switch characteristics. On resistance is less than 50Ω and is essentially constant over the analog signal range. Device specifications are ideal for battery powered circuitry.

These switches are available in a variety of formats as outlined below in the Pin Configurations section. The switch control logic inputs are compatible with CMOS logic. Also featured are "break-before-make" switching and low charge injection.

Maxim's DG304-DG307 and DG304A-DG307A families are electrically compatible and pin compatible with the original manufacturer's devices. All devices will operate with power supplies ranging from ±5V to ±18V. Single supply operation is implemented by connecting V⁻ to GND.

Note 4: OFF isolation = 20 log $\frac{V_S}{V_D}$, V_S = input to OFF switch, V_D = Output.

All DG304 family switches will operate with $\pm 15\text{V}$ power supplies. They can also be used with single ended power supplies ranging from +10V to +30V where the V^- terminal is connected to ground. In either case analog signals ranging from V^+ to V^- can be switched.

The on resistance variation with analog signal and supply voltage is shown in the Typical Operating Characteristics graphs. The temperature coefficient of R_{ON} is typically $0.5\%/^{\circ}\text{C}$. Typical on resistance matching from channel to channel is 10%. In addition, Table 1 outlines some typical parameters for single supply operation.
