

**THE DATASHEET OF  
RT1711PGQW**

## USB PD Port and Power Controller

### General Description

The RT1711P is a USB Type-C and Power Delivery (PD) controller, which complies with the latest USB Type-C and PD standards. The RT1711P integrates a complete Type-C transceiver including the Type-C termination resistors, Rp and Rd, and enables the USB Type-C detection including attach and orientation. It also integrates the physical layer of the USB BMC power delivery protocol, allowing power transfers of up to 100W and role swap. The BMC PD function provides full support for Alternate Modes on the USB Type-C standard. The RT1711P provides a complete power management solution, which consists of one barrel jack path and one VBUS path for charging systems. Another provider path provides a seamless voltage transition and avoids the discontinuity of voltage transition during USB PD power contracts.

### Applications

- Tablets
- Laptops
- Notebooks
- Monitors
- Power Banks
- TVs

### Pin Configuration

### Features

- **PD-Compatible Dual-Role**
- **Support USB PD3.0 and TCPC1.0**
- **Full Power Path Control**
  - ▶ **Barrel Jack Path : Up to 20V (N-MOSFET)**
  - ▶ **PD Provider & Consumer Path Up to 20V (N-MOSFET)**
- **Protection**
  - ▶ **VBUS Provider Path with Programmable Over-Current Protection (OCP) and Over-Voltage Protection (OVP)**
  - ▶ **VBUS Path with Aided Discharge**
  - ▶ **VCONN with Programmable Current Limit**
  - ▶ **VCONN with OVP Protection and Discharge**
  - ▶ **CC Pin 20V Short-VBUS Circuit Protection**
- **Adjustable DC-DC Output Voltages**
- **Current Capability Definition and Detection**
- **Cable Recognition and Alternate Modes Support**
- **Dead Battery and No Battery Support**
- **Low-Power Mode for Attach Detection**
- **BIST Mode Supported**
- **Support GPIO**
- **24-Lead WQFN Package**

### Ordering Information

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

### Marking Information

## Typical Application Circuit

### Provider/Consumer

Note : SYS3V3 is connected to a PMIC and is supplied by the PMIC.

1. DC-DC converter recommend best solution. The following table can pass USB PD compliance test.
2. The RT8131B is a high efficiency single phase synchronous buck DC-DC controller. Please refer to the RT8131B datasheet.
3. The RT8525D is a wide input operating voltage range step up controller. High voltage output and large output current are feasible by using an external N-MOSFET. Please refer to the RT8525D datasheet.

VIN	Watts	VOUT/IOUT	Item
12V to 20V	45W	5V, 9V, 12V, 15V/20V	RT8525D (Boost IC)
		3A, 3A, 3A, 3A, 2.25A	RT8131B (Buck IC)
18V to 20V	65W	5V, 9V, 12V, 15V/20V	RT8525D (Boost IC)
		3A, 3A, 3A, 3A, 3.25A	RT8131B (Buck IC)
24V	45W/65W/100W	5V, 9V, 12V, 15V, 20V	RT8131B (Buck IC)
		3A, 3A, 3A, 3A/5A, 3A/5A

**Functional Pin Description**

Pin No.	Pin Name	Pin Function
1	ADR	Address selection node when used with multiple type-C ports.
2	EN	External power path control input, active-high.
3	VCC	Input supply voltage.
4	VTUNE	Connected to FB pin of a DC-DC converter to adjust DC-DC output voltages.
5	GP2	High voltage open-drain gate driver, which may be used to drive an NMOS/PMOS power switch. This pin is connected to the gate of the power switch. (Related to VDC).
6	GP3	High voltage open-drain gate driver, which may be used to drive an NMOS/PMOS power switch. This pin is connected to the gate of the power switch. (Related to VDC).
7	VDC	Barrel jack or wireless charger DC power input pin for charging path control.
8	CC2	Type-C connector Configuration Channel (CC) 2, used to detect a cable plug event and determine the cable orientation.
9	VCONN	Regulated input voltage to power CCx pins as VCONN.
10	CC1	Type-C connector Configuration Channel (CC) 1, used to detect a cable plug event and determine the cable orientation.
11	VBUS	VBUS input using for OCP/OVP detection and as a power source for VBUS path control.
12	CS	Current sense input.
13	GP1A	High voltage open-drain gate driver, which may be used to drive an NMOS/PMOS power switch. This pin is connected to the gate of the power switch. (Related to VBUS).
14	GP1B	High voltage open-drain gate driver, which may be used to drive an NMOS/PMOS power switch. This pin is connected to the gate of the power switch. (Related to VBUS).
15	NC	No internal connection.
16, 25 (Exposed Pad)	GND	Ground. The exposed pad must be connected to GND and well soldered to a large copper PCB and for maximum power dissipation.
17	SCL	I <sup>2</sup> C interface serial clock input. Open-drain. An external pull-up resistor is required.
18	SDA	I <sup>2</sup> C serial data input/output. Open-drain. An external pull-up resistor is required.
19	INT_N	Interrupt output, active-low open-drain, to prompt the processor to read the registers.
20	GPIO5	Configurable GPIO with open-drain or push-pull type, used as switch control, DC-DC enable, audio enable, and accessory unit control.
21	GPIO4	Configurable GPIO with open-drain or push-pull type, used as switch control, DC-DC enable, audio enable, and accessory unit control.
22	GPIO3	Configurable GPIO with open-drain or push-pull type, used as switch control, DC-DC enable, audio enable, and accessory unit control.
23	GPIO2	Configurable GPIO with open-drain or push-pull type, used as switch control, DC-DC enable, audio enable, and accessory unit control.
24	GPIO1	Configurable GPIO with open-drain or push-pull type, used as switch control, DC-DC enable, audio enable, and accessory unit control.

Functional Block Diagram

**Absolute Maximum Ratings** (Note 1)

- VCC/VCONN ----- -0.3V to 6V
- CC1/CC2 (Testing condition: VCC ≥ 3V) ----- -0.3V to 24V
- CC1/CC2 (Testing condition: VCC < 3V) ----- -0.3V to 6V
- VBUS/VDC ----- - 0.3V to 24V
- Power Dissipation, P<sub>D</sub> @ T<sub>A</sub> = 25°C  
 WQFN-24L 3.5x3.5 ----- 3.5W
- Package Thermal Resistance (Note 2)  
 WQFN-24L 3.5x3.5, θ<sub>JA</sub> ----- 28.5°C/W  
 WQFN-24L 3.5x3.5, θ<sub>JC</sub> ----- 7°C/W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to 150°C
- ESD Susceptibility (Note 3)  
 HBM (Human Body Model) ----- 2kV

**Recommended Operating Conditions** (Note 4)

- Supply Input Voltage ----- 3V to 5.5V
- VBUS/VDC ----- 4V to 22V
- VCONN Supply Current ----- 200 to 400mA
- VCONN Supply Voltage ----- 4.75V to 5.5V
- Junction Temperature Range ----- -40°C to 125°C
- Ambient Temperature Range ----- -40°C to 85°C

**Electrical Characteristics**

(V<sub>CC</sub> = 3.3V, T<sub>A</sub> = 25°C, unless otherwise specified.)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
<b>Common Normative Signaling Requirements</b>						
Bit Rate	f <sub>BITRATE</sub>		270	300	330	Kbps
<b>Common Normative Signaling Requirements for Transmitter</b>						
Maximum difference between the bit-rate during the part of the packet following the Preamble and the reference bit-rate.	ρ <sub>BitRate</sub>		--	--	0.25	%
Time from the end of last bit of a Frame until the start of the first bit of the next Preamble.	t <sub>InterFrameGap</sub>		25	--	--	μs
Time before the start of the first bit of the Preamble when the transmitter shall start driving the line.	t <sub>StartDrive</sub>		-1	--	1	μs

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
<b>BMC Common Normative Requirements</b>

<b>N-MOSFET Gate Control Related Parameters</b>						
GP1A/GP1B		For N-MOSFET gate control	V <sub>BUS</sub> + V <sub>VCONN</sub> - 1	V <sub>BUS</sub> + V <sub>VCONN</sub> - 0.7	V <sub>BUS</sub> + V <sub>VCONN</sub> - 0.2	V
GP2/GP3		For N-MOSFET gate control	V <sub>VDC</sub> + V <sub>VCONN</sub> - 1	V <sub>VDC</sub> + V <sub>VCONN</sub> - 0.7	V <sub>VDC</sub> + V <sub>VCONN</sub> - 0.2	V

**Note 1.** Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

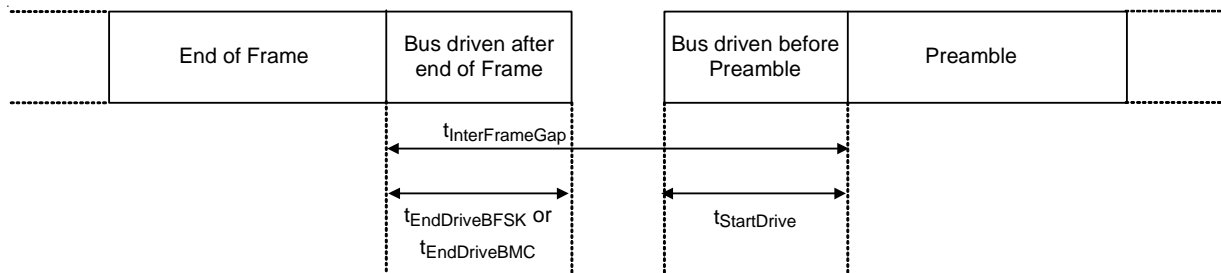

**Note 2.** θ<sub>JA</sub> is measured under natural convection (still air) at T<sub>A</sub> = 25°C with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard. θ<sub>JC</sub> is measured at the exposed pad of the package.

**Note 3.** Devices are ESD sensitive. Handling precaution is recommended.

**Note 4.** The device is not guaranteed to function outside its operating conditions.

Application Information

Output Voltage Setting for the DC-DC Converter

Figure 1

Figure 1 shows the RT1711P can change the output voltage ( $V_{OUT}$ ) of the DC-DC converter by controlling the VTUNE sinking current.

The following table shows the range of R1 value :

$V_{REF}$ of DC-DC	R1 Range ( $\Omega$ )
0.6V	60k to 80k
0.8V	60k to 80k
1.225V	60k to 80k
1.25V	60k to 80k

The default  $V_{OUT}$  needs to be set as 5V output, so that R2 value can be decided by the following equation :

$$R2 = \frac{R1}{\left(\frac{5V}{V_{REF}}\right) - 1}$$

The "Num" (register A6h, A7h) is a 10-bit number and each step is 25mV. The range of "Num" is 0 to 832 and the range of the output voltage ( $V_{OUT}$ ) is 5V to 20V.

The output voltage ( $V_{OUT}$ ) of the DC-DC converter can be programmed according to the following equation :

If the "Num" value is less than or equal to 200 :

$$V_{OUT} = 5V$$

If the "Num" value is greater than 200 :

$$V_{OUT} = 25mV \times \text{Num equal } 0 \text{ when the value is from } 0 \text{ to } 200.$$

For example :

Setting "Num" = 600 represents 15V output.

Setting "Num" = 0 to 200 represents 5V output.

I<sup>2</sup>C address Setting by the ADR Pin

Figure 2

Figure 2 shows I<sup>2</sup>C address setting by  $R_{ADR}$  resistor

Where  $R_{ADR} = 0\Omega$ , the I<sup>2</sup>C address shows below :

1	0	0	1	1	0	0	R/W
---	---	---	---	---	---	---	-----

MSB

LSB

Where  $R_{ADR} = 310k\Omega$ , the I<sup>2</sup>C address shows below :

MSB

LSB

**Type-C Detection**

The RT1711P implements multiple comparators that can be used by software to determine the state of the CC1, CC2 and VBUS pins. This status information provides the host processor with all of the information required to determine attach and detach status.

The RT1711P has three threshold comparators that match the USB Type-C specification for the three charge current levels that can be detected by a Type-C device. These comparators automatically cause interrupts to occur when there is a change of state.

The RT1711P also has a comparator that monitors if VBUS has reached a valid threshold or not. The DAC can be used to measure VBUS up to 20V which allows the software to confirm that changes to the VBUS line has occurred as expected based on Power Delivery (PD) to change the voltage level.

**Detection through Autonomous DRP Toggles**

The RT1711P has the capability to do autonomous DRP toggle. In DRP toggle the RT1711P implements DRP toggle between presenting as a SRC (source) and presenting as a SNK (sink). It can also present as a SRC or SNK only and monitor CC1, CC2 and VBUS status.

**PD Protocol Communication**

Type-C connector allows USB Power Delivery (PD) to be communicated over the connected CC pin between two ports. The communication method is the BMC Power Delivery protocol. Possible uses are outlined below.

- ▶ Negotiating and controlling power levels
- ▶ Alternative interfaces such as DisplayPort
- ▶ Role swap for dual-role ports that switch who is the source or sink
- ▶ Communication with USB Type-C full featured cables

The RT1711P integrates a BMC PD block which includes the BMC physical layer and packet buffer which allow packets to be sent and received by the host software through I2C accesses. The RT1711P allows host software to implement all features of USB BMC PD through writes and reads of the buffer and control of the RT1711P physical interface.

**Abbreviations :**

Term	Description
BMC	Biphase Mark Coding
TCPC	Type-C Port Controller
TCPCI	Type-C Port Controller Interface
TCPM	Type-C Port Manager

**Type-C Port Controller (TCPC) Interface :**

The Type-C Port Controller Interface, TCPCI, is the interface between a Type-C Port Manager and a Type-C Port Controller.

**The Controller Interface uses the I<sup>2</sup>C Protocol :**

- ▶ The TCPM is the only master on this I<sup>2</sup>C bus
- ▶ The TCPC is a slave device on this I<sup>2</sup>C bus
- ▶ Each Type-C port has its own unique I<sup>2</sup>C slave address  
The TCPC shall have equal numbers of unique I<sup>2</sup>C slave addresses and supported Type-C ports
- ▶ The TCPC supports fast-mode bus speed

- ▶ The TCPC has an open drain output, active low INT\_N Pin. This pin is used to indicate change of state, where INT\_N pin is asserted when any Alert Bits are set
- ▶ The TCPC supports an I/O nominal voltage range of 1.8V and 3.3V
- ▶ The TCPC can auto-increment the I<sup>2</sup>C internal register address of the last byte transferred during a read independent of an ACK/NACK from the master

**Register Map :**

Addr	Length	RegName	Bit	BitName	Default	Type	Description

**Thermal Considerations**

The junction temperature should never exceed the absolute maximum junction temperature  $T_{J(MAX)}$ , listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-ambient thermal resistance,  $\theta_{JA}$ , is highly package dependent. For a WQFN-24L 3.5x3.5 package, the thermal resistance,  $\theta_{JA}$ , is 28.5°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated as below:

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (28.5^\circ\text{C/W}) = 3.5\text{W for a WQFN-24L 3.5x3.5 package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed  $T_{J(MAX)}$  and the thermal resistance,  $\theta_{JA}$ . The derating curves in Figure 3 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 3. Derating Curve of Maximum Power Dissipation
