

# THE DATASHEET OF UM3488EESA

**+3.3V Low Power, ±15kV ESD-Protected, Fail-Safe,  
RS-422 Transceivers**

**UM3488EESA SOP8**  
**UM3488EEPA DIP8**  
**UM3491EESE SOP14**  
**UM3491EEPE DIP14**

**General Description**

The UM3488/UM3491 is ±15kV electrostatic discharge (ESD)-protected, high-speed transceivers for RS-422 communication that contain one driver and one receiver. The UM3491 contains an additional receiver and driver enable control. The device features fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted. This means that the receiver output will be a logic high if all transmitters on a terminated bus are disabled (high impedance). The UM3488/UM3491 allows transmit speeds up to 10Mbps. The device features enhanced ESD protection. All transmitter outputs and receiver inputs are protected to ±15kV using the Human Body Model.

These transceivers typically draw 180µA of supply current when unloaded, or when fully loaded with the drivers disabled.

The device has a 1/8-unit-load receiver input impedance that allows up to 256 transceivers on the bus. The UM3488/UM3491 is intended for full-duplex communications.

**Applications**

- RS-422 Communications
- Level Translators
- Transceivers for EMI-Sensitive Applications
- Industrial-Control Local Area Networks

**Features**

- ESD Protection for RS-422 I/O Pins ±15kV, Human Body Model
- True Fail-Safe Receiver while Maintaining EIA/TIA-422 Compatibility
- Maximum Data Rate up to 10Mbps
- Error-Free Data Transmission
- 1nA Low-Current Shutdown Mode (UM3491)
- Allow up to 256 Transceivers on the Bus

**Selector Guide**

Part Number	Half/Full Duplex	Data Rate (Mbps)	Slew-Rate Limited	Low-Power Shutdown	Receiver/Driver Enable	Quiescent Current (µA)	Transceivers On Bus	Pin Count
UM3488	full	10	Yes	No	No	180	256	8
UM3491	full	10	Yes	Yes	Yes	180	256	14

**Ordering Information**

Part Number	Temperature Range	Packaging Type	Shipping Qty
UM3488EESA	-40°C to +85°C	SOP8	3000pcs/13 Inch Tape & Reel
UM3488EEPA	-40°C to +85°C	DIP8	50pcs/Tube
UM3491EESE	-40°C to +85°C	SOP14	2500pcs/13 Inch Tape & Reel
UM3491EEPE	-40°C to +85°C	DIP14	25pcs/Tube

---

**Detailed Description**

The UM3488/UM3491 high-speed transceivers for RS-422 communication contain one driver and one receiver. The device features fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted, or when they are connected to a terminated transmission line with all drivers disabled.

The UM3488/UM3491 offer higher driver output slew-rate limits, allowing transmit speeds up to 10Mbps.

The UM3488/UM3491 is full-duplex transceiver. It operates from a single +3.3V supply. Drivers are output short-circuit current limited. Thermal shutdown circuitry protects drivers against excessive power dissipation. When activated, the thermal shutdown circuitry places the driver outputs into a high-impedance state.

**Receiver Input Filtering**

The receivers of the UM3488/UM3491 incorporate input filtering in addition to input hysteresis. This filtering enhances noise immunity with differential signals that have very slow rise and fall times. Receiver propagation delay increases by 20% due to this filtering.

**Fail-Safe**

The UM3488/UM3491 guarantees a logic-high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. This is done by setting the receiver threshold between -50mV and -200mV. If the differential receiver input voltage (A-B) is greater than or equal to -50mV, RO is logic high. If A-B is less than or equal to -200mV, RO is logic low. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the termination. With the receiver thresholds of the UM3488/UM3491, this results in a logic high with a 50mV minimum noise margin. Unlike previous fail-safe devices, the -50mV to -200mV threshold complies with the  $\pm 200\text{mV}$  EIA/TIA-422 standard.

 **$\pm 15\text{kV}$  ESD Protection**

As with all Union devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the UM3488/UM3491 have extra protection against static electricity. Union's engineers have developed state-of-the-art structures to protect these pins against ESD of  $\pm 15\text{kV}$  without damage.

The ESD-protected pins are tested with reference to the ground pin in a powered-down condition. They are tested to  $\pm 15\text{kV}$  using the Human Body Model.

## Applications Information

### 256 Transceivers on the Bus

The standard RS-422 receiver input impedance is 12k $\Omega$  (one-unit load), and the standard driver can drive up to 32 unit loads. The UM3491 has a 1/8-unit-load receiver input impedance (96k $\Omega$ ), allowing up to 256 transceivers to be connected in parallel on one communication line. Any combination of these devices and/or other RS-422 transceivers with a total of 32 unit loads or less can be connected to the line.

### Reduced EMI and Reflections

The UM3488/UM3491 is slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables. Its high-frequency harmonic components are much lower in amplitude, and the potential for EMI is significantly reduced.

In general, a transmitter's rise time relates directly to the length of an unterminated stub, which can be driven with only minor waveform reflections. The following equation expresses this relationship conservatively:

$$\text{Length} = t_{\text{RISE}} / (10 \times 1.5\text{ns/ft})$$

where  $t_{\text{RISE}}$  is the transmitter's rise time.

### Low-Power Shutdown Mode (UM3491)

Low-power shutdown mode is initiated by bringing both  $\overline{\text{RE}}$  high and DE low. In shutdown, the devices typically draw only 1nA of supply current.  $\overline{\text{RE}}$  and DE may be driven simultaneously; the parts are guaranteed not to enter shutdown if  $\overline{\text{RE}}$  is high and DE is low for less than 50ns. If the inputs are in this state for at least 600ns, the parts are guaranteed to enter shutdown.

Enable times  $t_{\text{ZH}}$  and  $t_{\text{ZL}}$  in the Switching Characteristics tables assume the part was not in a low-power shutdown state. Enable times  $t_{\text{ZH(SHDN)}}$  and  $t_{\text{ZL(SHDN)}}$  assume the parts were shut down. It takes drivers and receivers longer to become enabled from low-power shutdown mode ( $t_{\text{ZH(SHDN)}}$ ,  $t_{\text{ZL(SHDN)}}$ ) than from driver/receiver-disable mode ( $t_{\text{ZH}}$ ,  $t_{\text{ZL}}$ ).

### Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a foldback current limit on the output stage, provides immediate protection against short circuits over the whole common-mode voltage range. The second, a thermal shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature becomes excessive.

### Line Length vs. Data Rate

The RS-422 standard covers line lengths up to 4000 feet. For line lengths greater than 4000 feet, use the repeater application shown in Figure 12.
