

**THE DATASHEET OF
MT16JTF25664AY-1G4D1**

DDR3 SDRAM UDIMM

MT16JTF25664AY – 2GB

MT16JTF51264AY – 4GB

For component data sheets, refer to Micron's Web site: www.micron.com

Features

- DDR3 functionality and operations supported as per component data sheet
- 240-pin, unbuffered dual in-line memory module (UDIMM)
- Fast data transfer rates: PC3-10600, PC3-8500, or PC3-6400
- 2GB (256 Meg x 64), 4GB (512 Meg x 64)
- VDD = VDDQ = +1.5V ± 0.75V
- VDDSPD = + 3.0V to + 3.6V
- Reset pin for improved system stability
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Dual rank
- 8 internal device banks for concurrent operation
- Fixed burst length of 8 (BL8) and burst chop of 4 (BC4) via the mode register
- Adjustable data-output drive strength
- Serial presence-detect (SPD) EEPROM
- Gold edge contacts
- Pb-free
- Addresses are mirrored for second rank
- Fly-by topology
- Terminated command, address, and control bus

Figure 1: 240-Pin UDIMM (MO-269 R/C B)

PCB height: 30mm (1.18in)

Options

- Operating temperature¹
 - Commercial (0°C ≤ T_A ≤ +70°C)
 - Industrial (-40°C ≤ T_A ≤ +85°C)
- Frequency/CAS latency
 - 1.5ns @ CL = 9 (DDR3-1333)
 - 1.5ns @ CL = 10 (DDR3-1333)
 - 1.87ns @ CL = 7 (DDR3-1066)
 - 1.87ns @ CL = 8 (DDR3-1066)
 - 2.5ns @ CL = 5 (DDR3-800)
 - 2.5ns @ CL = 6 (DDR3-800)

Marking

None
I
-1G4
-1G3
-1G1
-1G0
-80C
-80B

Notes: 1. Pin 172 is NC for 2GB and A14 for 4GB.

Table 6: Pin Description

Symbol	Type	Description
A0–A14	Input	Address inputs: Provide the row address for ACTIVE commands and the column address and auto precharge bit for READ/WRITE commands to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed. The address inputs also provide the op-code during mode register command set. A0–A13 (2GB) A0–A14 (4GB).
BA0–BA2	Input	Bank address inputs: BA0, BA1 define to which device bank an ACTIVE, READ, WRITE, or PRECHARGE command is being applied. BA0, BA1 define which mode register, including MR, EMR, EMR(2), and EMR(3), is loaded during the LOAD MODE command.
CK0, CK0#, CK1, CK1#	Input	Clock: CK and CK# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of CK#. Output data (DQs and DQS/DQS#) is referenced to the crossings of CK and CK#.
CKE0, CK1	Input	Clock enable: CKE (registered HIGH) activates and CKE (registered LOW) deactivates clocking circuitry on the DDR3 SDRAM.
DM0–DM7	Input	Data input mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with that input data, during a write access. DM is sampled on both edges of DQS. Although DM pins are input-only, the DM loading is designed to match that of DQ and DQS7 pins.
ODT0 ODT1	Input	On-die termination: ODT (registered HIGH) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to the following pins: DQ, DQS, DQS# and DM. The ODT input will be ignored if disabled via the LOAD MODE command.
RAS#, CAS#, WE#	Input	Command inputs: RAS#, CAS#, and WE# (along with S#) define the command being entered.
RESET#	Input	Reset: An active LOW CMOS input referenced to Vss and not referenced to VREFCA or VREFDQ. The reset pin input receiver is a CMOS input and is defined as a rail-to-rail signal with a DC HIGH $\geq 0.8 \times V_{DDQ}$ and DC LOW $\leq 0.2 \times V_{DDQ}$ (1.20V for HIGH and 0.30V for LOW). RESET# assertion and desertion are asynchronous. System applications will most likely be unterminated, heavily loaded, and have very slow slew rates. A slow slew rate receiver design is recommended along with implementing on-chip noise filtering to prevent false triggering (RESET# assertion minimum pulse width is 100ns).
S0#, S1#	Input	Chip select: S# enables (registered LOW) and disables (registered HIGH) the command decoder. With both inputs HIGH, all outputs of the register(s) are disabled except for CKE and ODT. CKE, ODT, and chip select remain in previous state when both outputs are HIGH.
SA0–SA2	Input	Presence-detect address inputs: These pins are used to configure the SPD EEPROM address range.
SCL	Input	Serial clock for presence-detect: SCL is used to synchronize the presence-detect data transfer to and from the module.
DQ0–DQ63	I/O	Data input/output: Bidirectional data bus.
DQS0–DQS7 DQS0#–DQS7#	I/O	Data strobe: Output with read data, input with write data for source synchronous operation. Edge-aligned with read data, center-aligned with write data.
SDA	I/O	Serial presence-detect data: SDA is a bidirectional pin used to transfer addresses and data into and out of the SPD EEPROM on the module.
VDD	Supply	Power supply: 1.5V $\pm 0.075V$.
VDDSPD	Supply	Serial EEPROM positive power supply: +3.0V to +3.6V.
VREFDQ	Supply	Reference voltage: DQ, DM. $V_{DD}/2$.
VREFCA	Supply	Reference voltage: Command, address, and control. $V_{DD}/2$.
VSS	Supply	Ground.
VTT	Supply	Termination voltage: Used for address, command, control, and clock nets. $V_{DD}/2$.
NC	–	No connect: These pins should be left unconnected.

Functional Block Diagram

Figure 2: Functional Block Diagram

Notes: 1. ZQ ball on each DDR3 component is connected to an external 240Ω resistor that is tied to ground. Used for the calibration of the component's on-die termination and output driver.

General Description

The MT16JTF25664AY and MT16JTF51264AY DDR3 SDRAM modules are high-speed, CMOS, dynamic random-access 2GB and 4GB memory modules organized in a x64 configuration. These DDR3 SDRAM modules use internally configured 8-bank (1Gb and 2Gb) DDR3 SDRAM devices.

DDR3 SDRAM modules use double data rate architecture to achieve high-speed operation. The double data rate architecture is essentially an $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR3 SDRAM module effectively consists of a single $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding n -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

A bidirectional data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the receiver. DQS is a strobe transmitted by the DDR3 SDRAM device during READs and by the memory controller during WRITEs. DQS is edge-aligned with data for READs and center-aligned with data for WRITEs.

DDR3 SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Commands are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Fly-By Topology

DDR3 modules utilize faster clock speeds than earlier DDR technologies, making signal quality more important than ever. To ensure the best possible signal quality the clock and command/address busses have been routed in a fly-by topology, where each clock and address pin on each DRAM is connected to a single trace and terminated (rather than a tree structure, where the termination is off the module near the connector). Inherent to fly-by topology, the timing skew between the clock and DQS signals can be easily accounted for by utilizing the write leveling feature of DDR3.

Serial Presence-Detect Operation

DDR3 SDRAM modules incorporate serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes are programmed by Micron to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I²C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA (2:0), which provide eight unique DIMM/EEPROM addresses. Write protect (WP) is tied to VSS on the module, permanently disabling hardware write protect.

Electrical Specifications

Stresses greater than those listed in Table 7, may cause permanent damage to the module. This is a stress rating only, and functional operation of the module at these or any other conditions outside those indicated in the device data sheet is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Table 7: Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	
VDD ¹	VDD supply voltage relative to VSS	-0.4	+1.975	V	
VIN, VOUT	Voltage on any pin relative to VSS	-0.4	+1.975	V	
II	Input leakage current; Any input $0V \leq V_{IN} \leq V_{DD}$; VREF input $0V \leq V_{IN} \leq 0.95V$ (All other pins not under test = 0V)	Address inputs RAS#, CAS#, WE#, S#, CKE, ODT, BA	-16	+16	μA
		CK, CK#	-8	+8	
		DM	-2	+2	
IOZ	Output leakage current; $0V \leq V_{OUT} \leq V_{DDQ}$; DQs and ODT are disabled	-2	+2	μA	
IVREF	VREF leakage current; VREF = valid VREF level	-32	+32	μA	

Notes: 1. VREF must not be greater than $0.6 \times V_{DD}$. When VDD is less than 500mV, VREF may be equal to or less than 300mV.

Table 8: Operating Conditions

Symbol	Parameter	Min	Max	Units	
IVTT	Termination reference current from VTT	-600	+600	mA	
VTT ¹	Termination reference voltage – command address bus	$-0.483 \times V_{DD}$	$+0.517 \times V_{DD}$	V	
TA ^{2,4}	Module ambient operating temperature	Commercial	0	+70	$^{\circ}C$
		Industrial	-40	+85	$^{\circ}C$
TC ^{2,4}	DDR3 SDRAM component case operating temperature ³	Commercial	0	+85	$^{\circ}C$
		Industrial	-40	+95	$^{\circ}C$

Notes: 1. VTT termination voltage in excess of stated limit will adversely affect the command and address signals' voltage margin and will reduce timing margins.
2. TA and TC are simultaneous requirements.
3. Refresh rate is required to double when $85^{\circ}C < T_C \leq 95^{\circ}C$.
4. For further information, refer to technical note [TN-00-08: Thermal Applications](#), available on Micron's Web site.

Input Capacitance

Micron encourages designers to simulate the performance of the module to achieve optimum values. Simulations are significantly more accurate and realistic than a gross estimation of module capacitance when inductance and delay parameters associated with trace lengths are used in simulations.

Component AC Timing and Operating Conditions

Recommended AC operating conditions are given in the DDR3 component data sheets. Component specifications are available on Micron's Web site. Module speed grades correlate with component speed grades, as shown in Table 9.

Table 9: Module and Component Speed Grades

DDR3 components must be able to meet or exceed the listed speed grade.

Module Speed Grade	Component Speed Grade
-1G4	-15E
-1G3	-15
-1G1	-187E
-1G0	-187
-80C	-25E
-80B	-25

IDD Specifications

Table 10: DDR3 IDD Specifications and Conditions – 2GB

Values shown for each data rate are for the MT41J128M8 DDR3 SDRAM only and are computed from values specified in the 1Gb (128 Meg x 8) component data sheet

Parameter	Symbol	1333	1067	800	Units
Operating current 0: One bank ACTIVATE-to-PRECHARGE	IDD0	1,080	1,000	840	mA
Operating current 1: One bank ACTIVATE-to-READ-to-PRECHARGE	IDD1	1,280	1,120	960	mA
Precharge power down current: Slow exit	IDD2P	400	400	400	mA
Precharge power down current: Fast exit	IDD2P	160	160	160	mA
Precharge quiet standby current	IDD2Q	1,120	960	800	mA
Precharge standby current	IDD2N	1,200	1,040	880	mA
Active power-down current	IDD3P	880	720	640	mA
Active standby current	IDD3N	1,440	1,200	960	mA
Burst read operating current	IDD4R	2,080	1,840	1,600	mA
Burst write operating current	IDD4W	2,280	2,000	1,720	mA
Refresh current	IDD5B	4,640	4,080	3,440	mA
Self-refresh temperature current: MAX T _C = 85°C	IDD6	96	96	96	mA
Self-refresh temperature current (SRT-enabled): MAX T _C = 95°C	IDD6ET	144	144	144	mA
All bank interleaved read current	IDD7	4,400	3,840	3,600	mA

Table 11: DDR3 IDD Specifications and Conditions – 4GB

Values shown for each data rate are for the MT41J256M8 DDR3 SDRAM only and are computed from values specified in the 2Gb (256 Meg x 8) component data sheet

Parameter	Symbol	1333	1067	800	Units
Operating current 0: One bank ACTIVATE-to-PRECHARGE	IDD0	1,020	1,040	880	mA
Operating current 1: One bank ACTIVATE-to-READ-to-PRECHARGE	IDD1	1,320	1,060	1,000	mA
Precharge power down current: Slow exit	IDD2P	400	400	400	mA
Precharge power down current: Fast exit	IDD2P	160	160	160	mA
Precharge quiet standby current	IDD2Q	1,120	960	800	mA
Precharge standby current	IDD2N	1,120	960	800	mA
Active power-down current	IDD3P	960	800	720	mA
Active standby current	IDD3N	1,520	1,280	1,040	mA
Burst read operating current	IDD4R	1,880	1,880	1,640	mA
Burst write operating current	IDD4W	2,480	2,200	1,920	mA
Refresh current	IDD5B	5,120	4,560	3,920	mA
Self-refresh temperature current: MAX T _C = 85°C	IDD6	128	128	128	mA
Self-refresh temperature current (SRT-enabled): MAX T _C = 95°C	IDD6ET	192	192	192	mA
All bank interleaved read current	IDD7	3,760	3,520	3,280	mA

Serial Presence-Detect

Table 12: Serial Presence-Detect EEPROM DC Operating Conditions
All voltages referenced to V_{SS}

Parameter/Condition	Symbol	Min	Max	Units
Supply voltage	V _{DDSPD}	3.0	3.6	V
Input high voltage: Logic 1; All inputs	V _{IH}	V _{DDSPD} × 0.7	V _{DDSPD} + 0.5	V
Input low voltage: Logic 0; All inputs	V _{IL}	-0.6	V _{DDSPD} × 0.3	V
Output low voltage: I _{OUT} = 3mA	V _{OL}	-	0.4	V
Input leakage current: V _{IN} = GND to V _{DD}	I _{LI}	0.10	3	μA
Output leakage current: V _{OUT} = GND to V _{DD}	I _{LO}	0.05	3	μA
Standby current	I _{SB}	1.6	4	μA
Power supply current, READ: SCL clock frequency = 100 kHz	I _{CCR}	0.4	1	mA
Power supply current, WRITE: SCL clock frequency = 100 kHz	I _{CCW}	2	3	mA

Table 13: Serial Presence-Detect EEPROM AC Operating Conditions
All voltages referenced to V_{SS}

Parameter/Condition	Symbol	Min	Max	Units	Notes
SCL LOW to SDA data-out valid	t _{AA}	0.2	0.9	μs	1
Time the bus must be free before a new transition can start	t _{BUF}	1.3	-	μs

SDA and SCL fall time	t _F	-	300	ns	2
Data-in hold time	t _{HD:DAT}	0	-	μs	
Start condition hold time	t _{HD:STA}	0.6	-	μs	
Clock HIGH period	t _{HIGH}	0.6	-	μs	
Noise suppression time constant at SCL, SDA inputs	t _I	-	50	ns	
Clock LOW period	t _{LOW}	1.3	-	μs	
SDA and SCL rise time	t _R	-	0.3	μs	2
SCL clock frequency	f _{SCL}	-	400	kHz	
Data-in setup time	t _{SU:DAT}	100	-	ns	
Start condition setup time	t _{SU:STA}	0.6	-	μs	3
Stop condition setup time	t _{SU:STO}	0.6	-	μs	
WRITE cycle time	t _{WRC}	-	10	ms	4

- Notes:
1. To avoid spurious start and stop conditions, a minimum delay is placed between SCL = 1 and the falling or rising edge of SDA.
 2. This parameter is sampled.
 3. For a restart condition, or following a WRITE cycle.
 4. The SPD EEPROM WRITE cycle time (t_{WRC}) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal ERASE/PROGRAM cycle. During the WRITE cycle, the EEPROM bus interface circuit is disabled, SDA remains HIGH due to pull-up resistance, and the EEPROM does not respond to its slave address.

Table 14: Serial Presence-Detect Matrix

Byte	Description	Entry (Version)	2GB	4GB
0	CRC coverage EEPROM device size Number of SPD bytes written	Bytes 0-116 256 bytes 176 bytes	92	92
1	SPD revision	Rev 1.0	10	10
2	DRAM device type (technology)	DDR3 SDRAM	0B	0B
