THE DATASHEET OF

BUF01900AIPW

SBOS337A − OCTOBER 2006 − REVISED OCTOBER 2006

Programmable Voltage Source with Memory

FEATURES

- **10-BIT RESOLUTION**
- **RAIL-TO-RAIL OUTPUT**
- **ONBOARD NONVOLATILE MEMORY**
- **I_{OUT}: 100mA**
- **LOW SUPPLY CURRENT: 900μA**
- **SUPPLY VOLTAGE: 7V to 18V**
- **DIGITAL SUPPLY: 2.0V to 5.5V**
- **INDUSTRY-STANDARD, TWO-WIRE INTERFACE**
- **HIGH ESD RATING: 2kV HBM, 500V CDM**

APPLICATIONS

- **LCD PANEL V_{COM} CALIBRATION**
- **LCD PANEL BRIGHTNESS AND CONTRAST CONTROL**
- **POTENTIOMETER REPLACEMENT**
- **MOTOR DRIVE**
- **PROGRAMMABLE POWER SUPPLY**
- **PROGRAMMABLE OFFSET ADJUSTMENT**
- **ACTUATOR CONTROL**

BUF01900, BUF01901 RELATED PRODUCTS

FEATURES	PRODUCT
22V High Supply Voltage Gamma Buffers	BUF11705
12--Channel Programmable Buffer, 10-Bit, V_{COM}	BUF12800
20-Channel Programmable Buffer, 10-Bit, V_{COM}	BUF20800
16-Channel Programmable Buffer with Memory	BUF16820
20-Channel Programmable Buffer with Memory	BUF20820

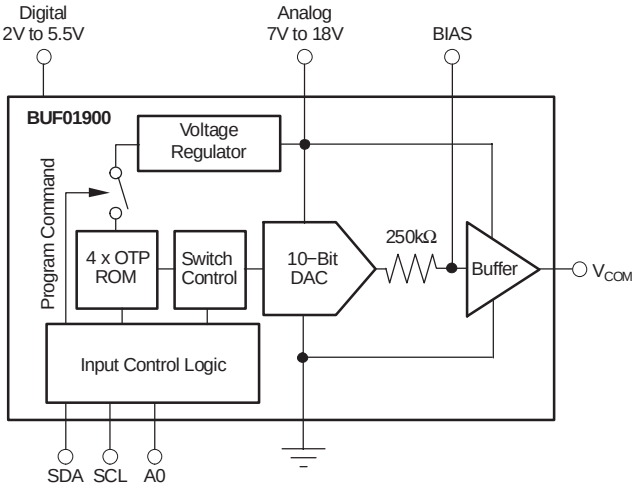
DESCRIPTION

The BUF01900 and BUF01901 provide a programmable voltage output with 10-bit resolution. Programming of the output occurs through an industry-standard, two-wire serial interface. Once the correct V_{COM} voltage is established it can easily be stored into the integrated nonvolatile memory.

An initial output voltage and adjustment range can be set by an external resistor-divider. With its large output current capability (up to 100mA), the BUF01900 and BUF01901 are ideally suited as programmable V_{COM} calibrators in LCD panels.

The BUF01901 has the digital-to-analog converter (DAC) output brought out directly. It has a slightly lower cost than the BUF01900, and works very well with the integrated V_{COM} in traditional gamma buffers such as the BUFxx702, BUFxx703, BUFxx704 and BUF11705.

The BUF01900 and BUF01901 are both available in TSSOP-8 and 3mm x 3mm DFN-10 packages. The DFN-10 package (only 0.9mm in height) is especially well-suited for notebook computers. Both devices are specified from −40°C to +85°C.



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS(1)

Supply Voltage, V_S	+20V
Supply Voltage, V_{SD}	+6V
Signal Input Terminals,	
BIAS:	
Voltage	−0.5V to V_S +0.5V
SCL, SDA, A0, A1:	
Voltage	−0.5V to +6V
Current	±10mA
Output Short Circuit(2)	Continuous
Operating Temperature	−40°C to +95°C
Storage Temperature	−65°C to +150°C
Junction Temperature	+125°C
ESD Rating:	
Human Body Model (HBM)	2000V
Charged-Device Model (CDM)	500V

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.

(2) Short-circuit to ground.

ORDERING INFORMATION(1)

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	PACKAGE MARKING
BUF01900	DFN-10	DRC	BOO
BUF01900	TSSOP-8	PW	F01900
BUF01901	DFN-10	DRC	BOP
BUF01901	TSSOP-8	PW	F01901

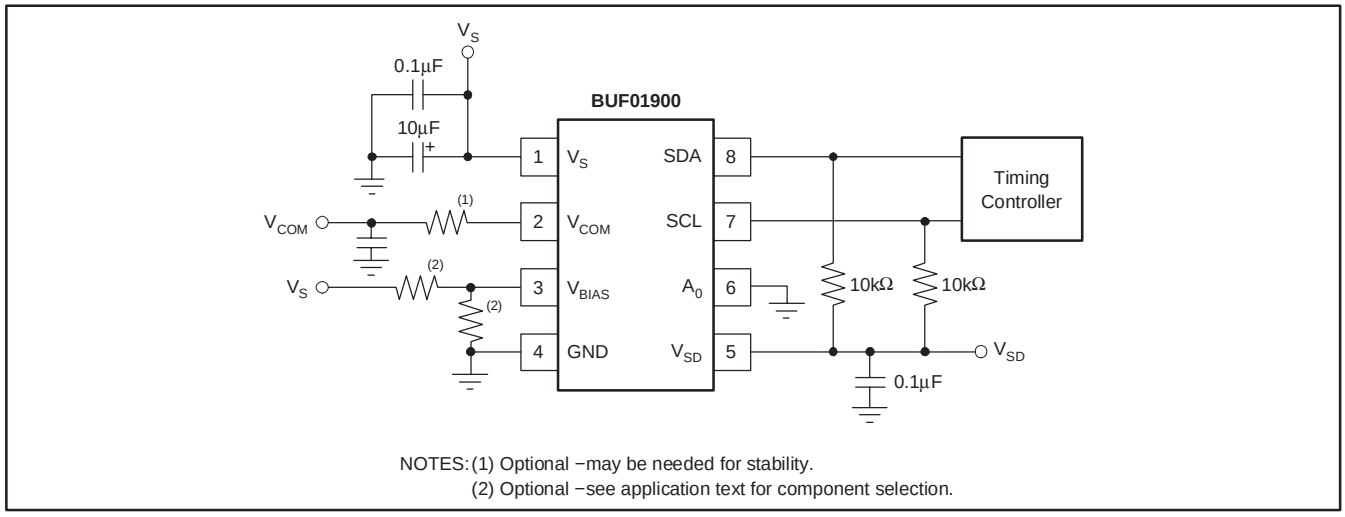
APPLICATIONS INFORMATION

OVERVIEW

The BUF0190x family of products consists of a 10-bit digital-to-analog converter (DAC) that is programmed through an industry-standard two-wire interface. It contains on-chip nonvolatile memory that stores a specific DAC value that is read at power-up. The BUF0190x family consists of two devices: The BUF01900 contains a voltage buffer that is capable of driving high-current; the BUF01901 is a lower-cost version without the buffer. The BUF0190x is especially well-suited for V_{COM} calibration in LCD panels; however, it can also be used in many other applications. Figure 14 shows the BUF01900 in a typical configuration.

BUF01900: ON-CHIP BUFFER

Unlike many programmable V_{COM} calibrators on the market, the BUF01900 offers an integrated V_{COM} buffer with high current output drive capability. The output is capable of delivering peak currents over 100mA to within 4V from the positive supply and to within 2V from the negative supply. Using this option is very cost-effective and convenient in systems that do not use multi-channel gamma buffers with integrated V_{COM} drive. Figure 15 shows the BUF01900 in a typical configuration.



NOTES: (1) Optional −may be needed for stability.
(2) Optional −see application text for component selection.

Figure 14. Typical Application Diagram

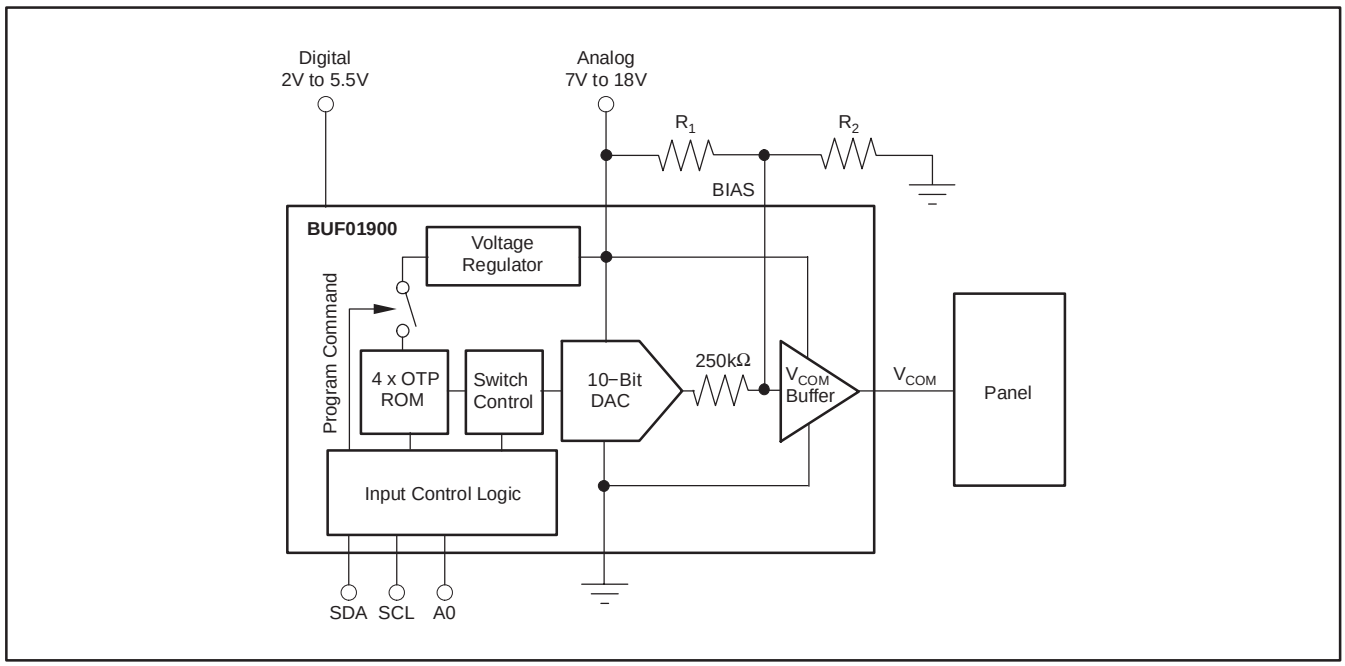


Figure 15. BUF01900 Typical Configuration

BUF01901: USING EXTERNAL V_{COM} BUFFER

Many LCD panel modules use gamma buffers, such as TI's BUFxx704, BUFxx703, BUF11702 and the new BUF11705, that already include an integrated V_{COM} driver. Some other LCD modules use more complicated compensation schemes that require an external high-speed V_{COM} op amp. BUF01901 is optimized for lowest cost and is intended to be used with an external V_{COM} buffer or op amp. Figure 16 illustrates a typical configuration of the BUF01901 with the BUF11705.

ON-CHIP NONVOLATILE MEMORY

The BUF0190x is optimized for the smallest die size available and consequently the lowest cost to support high volume production. The on-chip OTP (one-time-programmable) memory helps to achieve significant die size reduction over EEPROM memory technology. This reduction is partly because of the smaller area of the OTP memory cell, but also a result of the fact that an EEPROM requires a high programming voltage typically generated with an onboard charge pump. OTP memory technology does not require the higher programming voltage; consequently, no charge pump is needed, resulting in a smaller and lower-cost solution.

During production, the V_{COM} voltage is typically adjusted only once. However, to allow for programming errors and rework, the BUF0190x supports a total of four write cycles to the OTP memory. This capacity means that the previously programmed code in the OTP can be overwritten a total of three times.

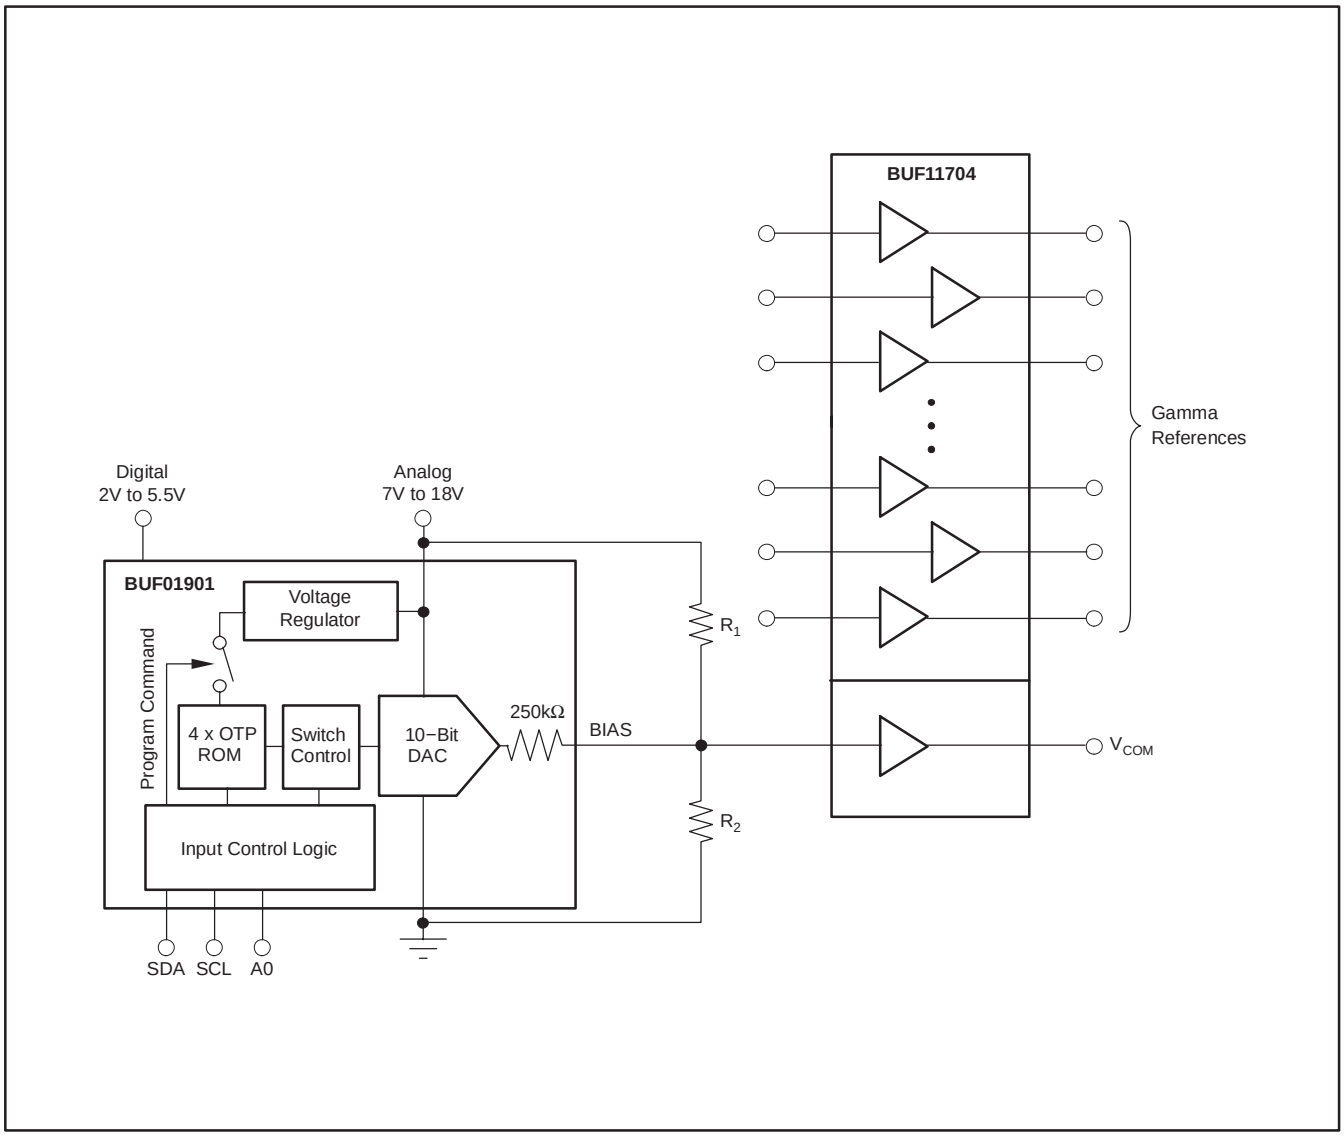

Figure 16. BUF01901 Typical Configuration

POWER-SUPPLY VOLTAGE

The BUF0190x can be powered using an analog supply voltage from 7V to 18V, and a digital supply from 2V to 5.5V. The digital supply must be applied prior to the analog supply to avoid excessive current and power consumption.

During programming of the OTP, the analog power supply must be at least 8.5V.

BUFFER INPUT AND OUTPUT RANGE

The integrated buffer has a single p-channel input stage. The input range includes the positive supply and extends down to typically 0.8V above the negative supply (GND). In a typical LCD application, this is normally sufficient because the nominal V_{COM} level is often close to $V_2/2$ and, therefore, fairly far away from either supply rail. In addition, the adjustment range is usually not much larger than 1V in either direction of the nominal V_{COM} voltage. In applications requiring a wider output swing, the output voltage to the buffer should be limited to approximately 0.8V above the negative power supply to keep the buffer input stage in its linear operating region. For lower input voltages, the output results might not be valid; however, they will also not lead to damage of the device.

The Rail-to-Rail output stage is designed to drive large peak currents greater than 100mA.

TWO-WIRE BUS OVERVIEW

The BUF0190x communicates through an industry-standard, two-wire interface to receive data in slave mode. This standard uses a two-wire, open-drain interface that supports multiple devices on a single bus. Bus lines are driven to a logic low level only. The device that initiates the communication is called a *master*, and the devices controlled by the master are *slaves*. The master generates the serial clock on the clock signal line (SCL), controls the bus access, and generates START and STOP conditions.

To address a specific device, the master initiates a START condition by pulling the data signal line (SDA) from a HIGH to LOW logic level while SCL is HIGH. All slaves on the bus shift in the slave address byte, with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the slave being addressed responds to the master by generating an Acknowledge and pulling SDA LOW.

Data transfer is then initiated and eight bits of data are sent, followed by an Acknowledge bit. During data transfer, SDA must remain stable while SCL is HIGH. Any change in SDA while SCL is HIGH will be interpreted as a START or STOP condition.

Once all data has been transferred, the master generates a STOP condition, indicated by pulling SDA from LOW to HIGH while SCL is HIGH.

The BUF0190x can act only as a slave device; therefore, it never drives SCL. The SCL is only an input for the BUF0190x.

ADDRESSING THE BUF01900 AND BUF01901

The address of the BUF0190x in the TSSOP-8 package is 111011x, where *x* is the state of the A0 pin. When the A0 pin is LOW, the device acknowledges on address 76h. If the A0 pin is HIGH, the device acknowledges on address 77h. Table 1 summarizes device addresses.

Table 1. Quick-Reference Table of Addresses

DEVICE/COMPONENT	ADDRESS
TSSOP Package:	
A0 pin is LOW (device will acknowledge on address 76h)	1110110
A0 pin is HIGH (device will acknowledge on address 77h)	1110111
DFN Package:	
A0 pin is LOW, A1 is LOW (device will acknowledge on address 74h)	1110100
A0 pin is HIGH, A1 is LOW (device will acknowledge on address 75h)	1110101
A0 pin is LOW, A1 is HIGH (device will acknowledge on address 76h)	1110110
A0 pin is HIGH, A1 is HIGH (device will acknowledge on address 77h)	1110111

The address of the BUF0190x in the DFN-10 package is 11101yx, where *x* is the state of the A0 pin and *y* is the state of the A1 pin. When the A0 and A1 pins are both LOW, the device acknowledges on address 74h. If the A0 is HIGH and A1 is LOW, the device acknowledges on address 75h. When the A0 is LOW, and A1 is HIGH, the device acknowledges on address 76h. If the A0 and A1 pins are both HIGH, the device address is 77h.

Other addresses are possible through a simple mask change. Contact your TI representative for ordering information and availability.

DATA RATES

The two-wire bus operates in one of three speed modes:

- Standard: allows a clock frequency of up to 100kHz;
- Fast: allows a clock frequency of up to 400kHz; and
- High-speed mode (or Hs mode): allows a clock frequency of up to 3.4MHz.

The BUF0190x is fully compatible with all three modes. No special action is required to use the device in Standard or Fast modes, but High-speed mode must be activated. To activate High-speed mode, send a special address byte of 00001xxx, with SCL ≤ 400kHz, following the START condition; *xxx* are bits unique to the Hs-capable master, which can be any value. This byte is called the *Hs master code*. (Note that this is different from normal address bytes—the low bit does not indicate read/write status.) The BUF0190x will respond to the High-speed command regardless of the value of these last three bits. The BUF0190x does not acknowledge this byte; the communication protocol prohibits acknowledgment of the Hs master code. On receiving a master code, the BUF0190x switches on its Hs mode filters, and communicates at up to 3.4MHz.

Additional high-speed transfers may be initiated without resending the Hs mode byte by generating a repeat START without a STOP. The BUF0190x switches out of Hs mode with the next STOP condition.

GENERAL CALL RESET AND POWER-UP

The BUF0190x responds to a General Call Reset, which is an address byte of 00h (0000 0000) followed by a data byte of 06h (0000 0110). The BUF0190x acknowledges both bytes. Upon receiving a General Call Reset, the BUF0190x performs a full internal reset, as though it had been powered off and then on. It always acknowledges the General Call address byte of 00h (0000 0000), but does not acknowledge any General Call data bytes other than 06h (0000 0110).

The BUF0190x automatically performs a reset upon power-up. As part of the reset, the BUF0190x is configured for the output to change to the programmed OTP memory value, or to mid-scale, '1000000000', if the OTP value has not been programmed. Table 2 provides a summary of command codes.

Table 2. Quick-Reference Table of Command Codes

COMMAND	CODE
General Call Reset	Address byte of 00h followed by a data byte of 06h.
High-Speed Mode	00001xxx, with SCL ≤ 400kHz; where *xxx* are bits unique to the Hs-capable master. This byte is called the Hs master code.

READ/WRITE OPERATIONS:

Read commands are performed by setting the read/write bit HIGH. Setting the read/write bit LOW performs a write transaction.

Figure 17 and Figure 18 show the timing diagrams for read and write operations.

Writing:

To write to the DAC register:

1. Send a START condition on the bus.
2. Send the device address and read/write bit = LOW. The BUF01900/BUF01901 will acknowledge this byte.
3. Send two bytes of data for the DAC register. Begin by sending the most significant byte (bits D15—D8; only bits D9 and D8 are used, and D15—D13 must *not* be 010 or 001), followed by the least significant byte (bits D7—D0). The register is updated after receiving the second byte.
4. Send a STOP condition on the bus.

The BUF0190x acknowledges each data byte. If the master terminates communication early by sending a STOP or START condition on the bus, the DAC output will not update.

Reading:

To read the register of the DAC:

1. Send a START condition on the bus.
2. Send the device address and read/write bit = HIGH. The BUF0190x will acknowledge this byte.
3. Receive two bytes of data. The first received byte is the most significant byte (bits D15—D8; only bits D9 and D8 have meaning, and bits D15—D12 will show the programming status of the OTP memory). See Table 3. The next byte is the least significant byte (bits D7—D0).
4. Acknowledge after receiving the first byte only.
5. Do not acknowledge the second byte of data or send a STOP condition on the bus.

Communication may be terminated by the master by sending a premature STOP or START condition on the bus, or by not sending the Acknowledge.

Table 3. OTP Memory Status

CODE (Bits D15 − D12)	OTP PROGRAMMING STATUS
0000	OTP has not been programmed.
0001	OPT has been programmed once.
0011	OTP has programmed twice.
0111	OPT has programmed three times.
1111	OTP has programmed all four times.

ACQUIRE OF OTP MEMORY

An acquire command updates the DAC output to the value stored in OTP memory. If the OTP memory has not been programmed, the DAC output code is '0000000000'.

Figure 19 shows the timing diagram for the acquire command.

Acquire Command

1. Send a START condition on the bus.
2. Send the device address and read/write bit = LOW. The device will acknowledge this byte.
3. Send the acquire command. Bits D7—D5 must be set to 001. Bits D4—D0 do not have meaning. This byte will be acknowledged.
4. Send a STOP condition on the bus.

Writing OTP Memory

The BUF0190x is able to write to the OTP memory a maximum of four times. Writing to the OTP memory a fourth time uses all available memory and disables the ability to perform additional writes (see table 3). A reset or acquire command updates the DAC output to the most recently written OTP memory value.

When programming the OTP memory, the analog supply voltage must be between 8.5V and 18V.

Write commands are performed by setting the read/write bit LOW.

To write to OTP memory:

1. Send a START condition on the bus.
2. Send the device address and read/write bit = LOW. The BUF0190x acknowledges this byte.
3. Send two bytes of data for the OTP memory. Begin by sending the most significant byte first (bits D15—D8, of which only bits D9 and D8 are data bits, and bits D15—D13 must be 010), followed by the least significant byte (bits D7—D0). The register updates after receiving the second byte.
4. Send a STOP condition on the bus.

The BUF0190x acknowledges each data byte. If the master terminates communication early by sending a STOP or START condition on the bus, the specified OTP register will not be updated. Writing an OTP register updates the DAC output voltage.

Programming timing is taken from the two-wire bus. Therefore, the master must provide correct timing on the bus to ensure data is successfully written into OTP memory. Figure 20 shows the timing requirements for timing when the OTP write supply and OTP write signal are active.

V_{COM} CALIBRATION

The BUF0190x provides a simple, time- and cost-efficient means to adjust the flicker performance of LCD panels either manually or automatically during the final stages of the LCD panel manufacturing process.

The 10-bit adjustment resolution of the BUF0190x exceeds the typical adjustment resolution of existing V_{COM} calibrators significantly. As with a traditional V_{COM} adjustment, which uses a mechanical potentiometer and a voltage divider for adjustment (see Figure 21), the BUF0190x uses an external voltage divider that is used to set the initial V_{COM} voltage as well as the adjustment range.

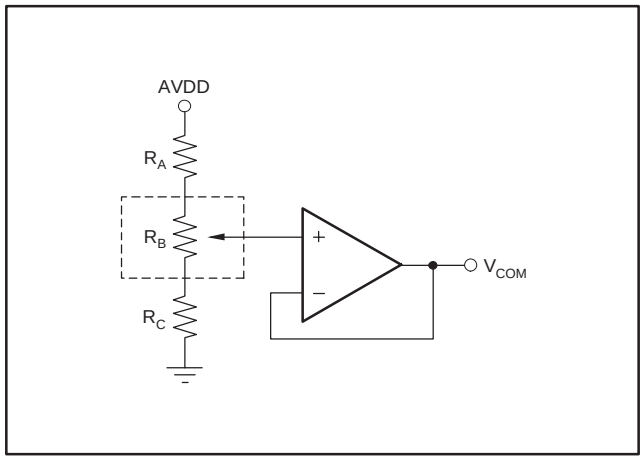

Figure 21. Traditional V_{COM} Adjustment

As Figure 22 shows, the 10-bit DAC acts as a Rail-to-Rail output voltage source with a nominal 250kΩ of output impedance. For example, at Code 000h, the lowest V_{COM} voltage is achieved since the 250kΩ impedance is now in parallel with R_2, which lowers the impedance of the lower side of the voltage divider. Consequently, code 3FFh results in the highest adjustable V_{COM} voltage.

Once the desired output level is obtained, the part can store the final setting using the non-volatile on-chip memory. See *Programming* section for detailed information.

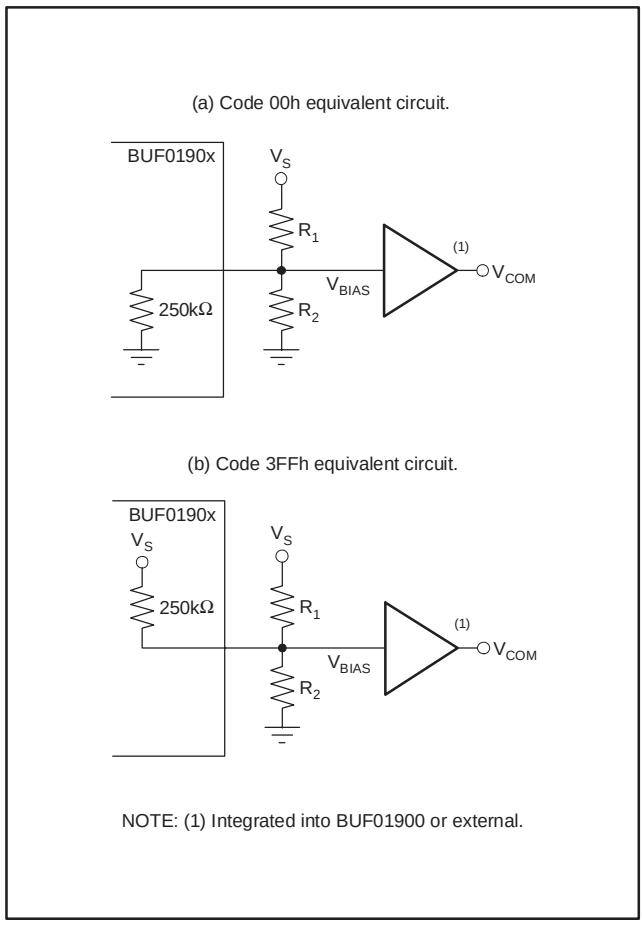

Figure 22. Simplified Block Diagram for V_{COM} Adjustment using BUF0190x

SELECTING THE ADJUSTMENT STEP SIZE

A maximum of 1024 adjustment steps can be realized with the BUF0190x, leading to very high adjustment resolution and very small step sizes. This flexibility can be advantageous during the panel development phase. In a practical production setting, however, this capability might lead to adjustment times that can be too long. A simple solution is to increase the step size between settings to more practical values for mass production. Limiting the number of adjustment steps between code 000h and code 3FFh to between 16 and 128 has been shown to typically yield acceptable adjustment results in the smallest amount of adjustment time.

EXTERNAL VOLTAGE DIVIDER RESISTOR SELECTION

The external resistive voltage-divider consisting of R_1 and R_2 (see Figure 16, Figure 17, and Figure 18) sets both the maximum value of the V_{COM} adjustment range and the initial V_{COM} voltage. Follow the steps below to calculate the correct values for R_1 and R_2

Step 1: Choose the supply voltage, (V_S)
Step 2: Set the nominal V_{COM} voltage. This voltage is the V_{COM} voltage at which the unadjusted panel should be at power-on. The default power-up DAC code is midscale.
Step 3: Choose the V_{COM} adjustment range. The adjustment range is the difference between the lowest and the highest desired V_{COM} voltage. If the default power-up code is not overwritten by software at the beginning of the adjustment cycle, the adjustment range is symmetrical around the chosen nominal V_{COM} voltage.
Step 4: Calculate the resistors based on the following formulas or simply download the Microsoft Excel™ calculator located in the product folder of BUF0190x available at www.ti.com.

$$R_1 = \frac{250k\Omega \cdot Adj\_range}{V_{COM} - 0.5 \cdot (Adj\_range)} \quad (1)$$

$$R_2 = \frac{1}{\frac{V_S}{V_{COM}}\left(\frac{1}{R_1} + \frac{1}{500k\Omega}\right) - \frac{1}{R_1} - \frac{1}{250k\Omega}} \quad (2)$$

CALCULATING THE V_{COM} OUTPUT VOLTAGE

With R_1 and R_2 properly set, V_{BIAS} or V_{COM} output voltage can be calculated for any digital code with the following formula:

$$V_{COM} = \frac{250k\Omega \cdot R_2 \cdot V_S + R_1 \cdot R_2 \cdot V_S\,(Code/1023)}{R_1 \cdot R_2 + 250k\Omega \cdot (R_1 + R_2)} \quad (3)$$

CALCULATING THE ADJUSTMENT RESOLUTION

The resolution of the adjustment is a function of the step size. The resolution can be calculated by simply dividing the chosen adjustment range by the number of steps:

Resolution = Adj_range/steps (example: 32 steps between code 0h and code 3FFh)

DESIGN EXAMPLE

Step 1: Supply Voltage is 10V.
Step 2: Nominal V_{COM} is determined to be 4V.
Step 3: The desired total adjustment range is 1V. In the case of using the default power-up DAC code (midscale), the adjustment range for the V_{COM} voltage will be from 3.5V to 4.5V.
Step 4: Calculation of R_1 and R_2
R_1 = 71.4kΩ => choose closest 1% resistor (71.5kΩ)
R_2 = 45.5kΩ => choose closest 1% resistor (45.3kΩ)
Step 5: Appropriate number of adjustment steps between code 00h and code 3FFh is determined to be 32. This value leads to a step size of 32 codes between adjustment points, which translates into approximately 31mV voltage difference between steps.

MOTOR DRIVE CIRCUIT

The BUF01900 can be used to drive small motors directly because of the large output drive capability (> 100mA), as illustrated in Figure 23.

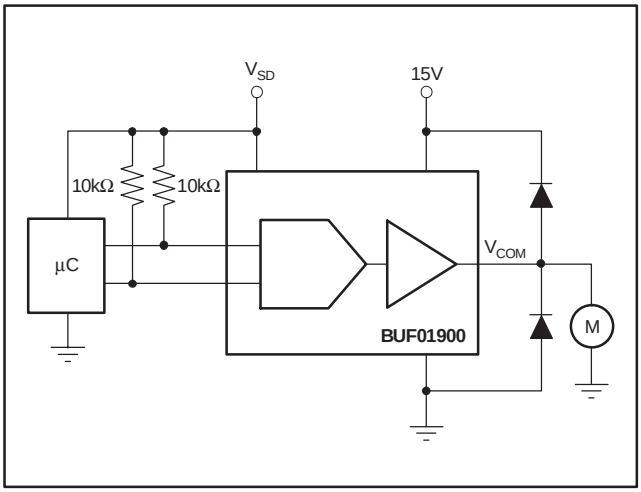

Figure 23. Motor Drive Circuit

PROGRAMMABLE POWER SUPPLY

The BUF0190x integrated buffer amplifier can drive large capacitive loads (see Typical Characteristics) and greater than 100mA of output current, making it well-suited for programmable power supplies.

Note that the BUF01900 integrated buffer has an input range that only extends to about 0.8V above GND; therefore, the programmable power supply is not able to output voltages less than approximately 0.8V.

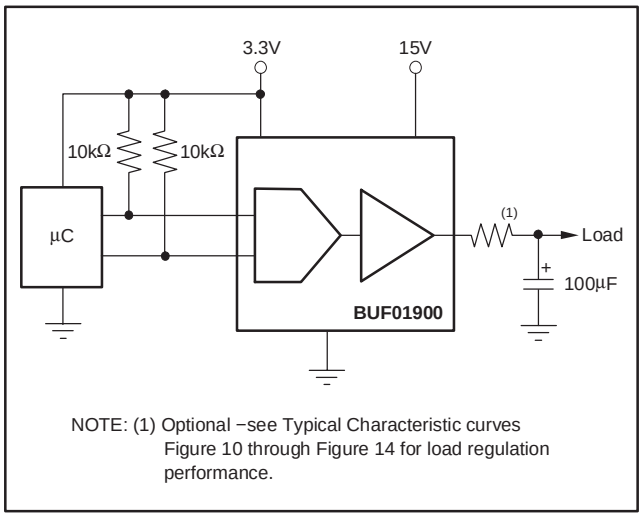

Figure 24. Programmable Power Supply

QFN/DFN THERMALLY-ENHANCED PACKAGE

The BUF0190x uses the 10-lead DFN package, a thin, thermally-enhanced package designed to eliminate the use of bulky heat sinks and slugs traditionally used in thermal packages. The DFN package can be easily mounted using standard printed circuit board (PCB) assembly techniques. See QFN/SON PCB Attachment Application Note (SLUA271) available at www.ti.com.

The thermal resistance junction to ambient ($R_{\theta JA}$) of the DFN package depends on the PCB layout. Using thermal vias and wide PCB traces improves thermal resistance. The thermal pad must be soldered to the PCB. The thermal pad on the bottom of the package should be connected to GND.

Soldering the exposed thermal pad significantly improves board-level reliability during temperature cycling, key push, package shear, and similar board-level tests. Even with applications that have low-power dissipation, the exposed pad must be soldered to the PCB to provide structural integrity and long-term reliability.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

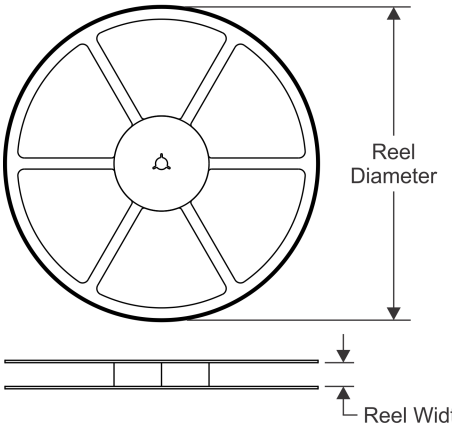
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

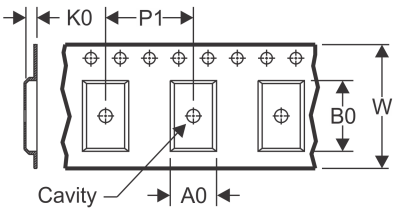
(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

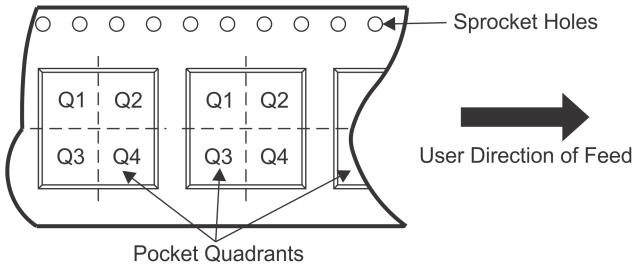


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
BUF01900AIDRCR	VSON	DRC	10	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

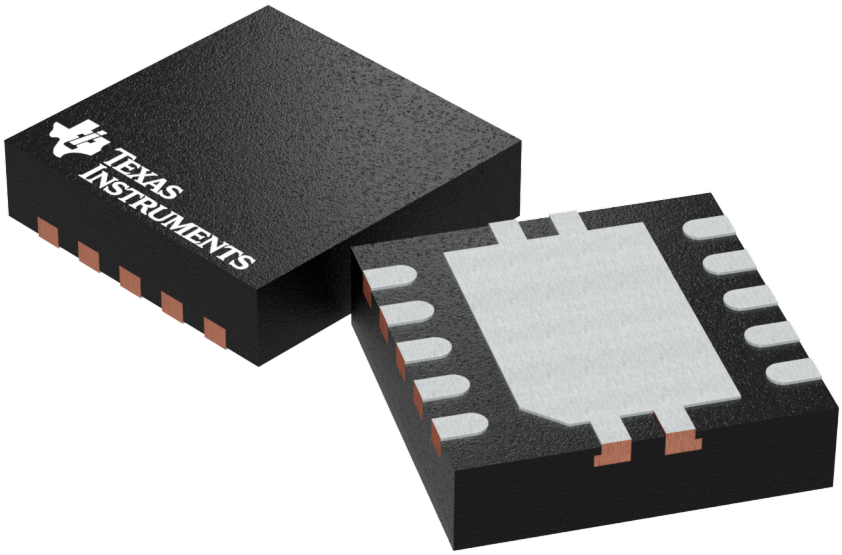
PLASTIC SMALL OUTLINE - NO LEAD



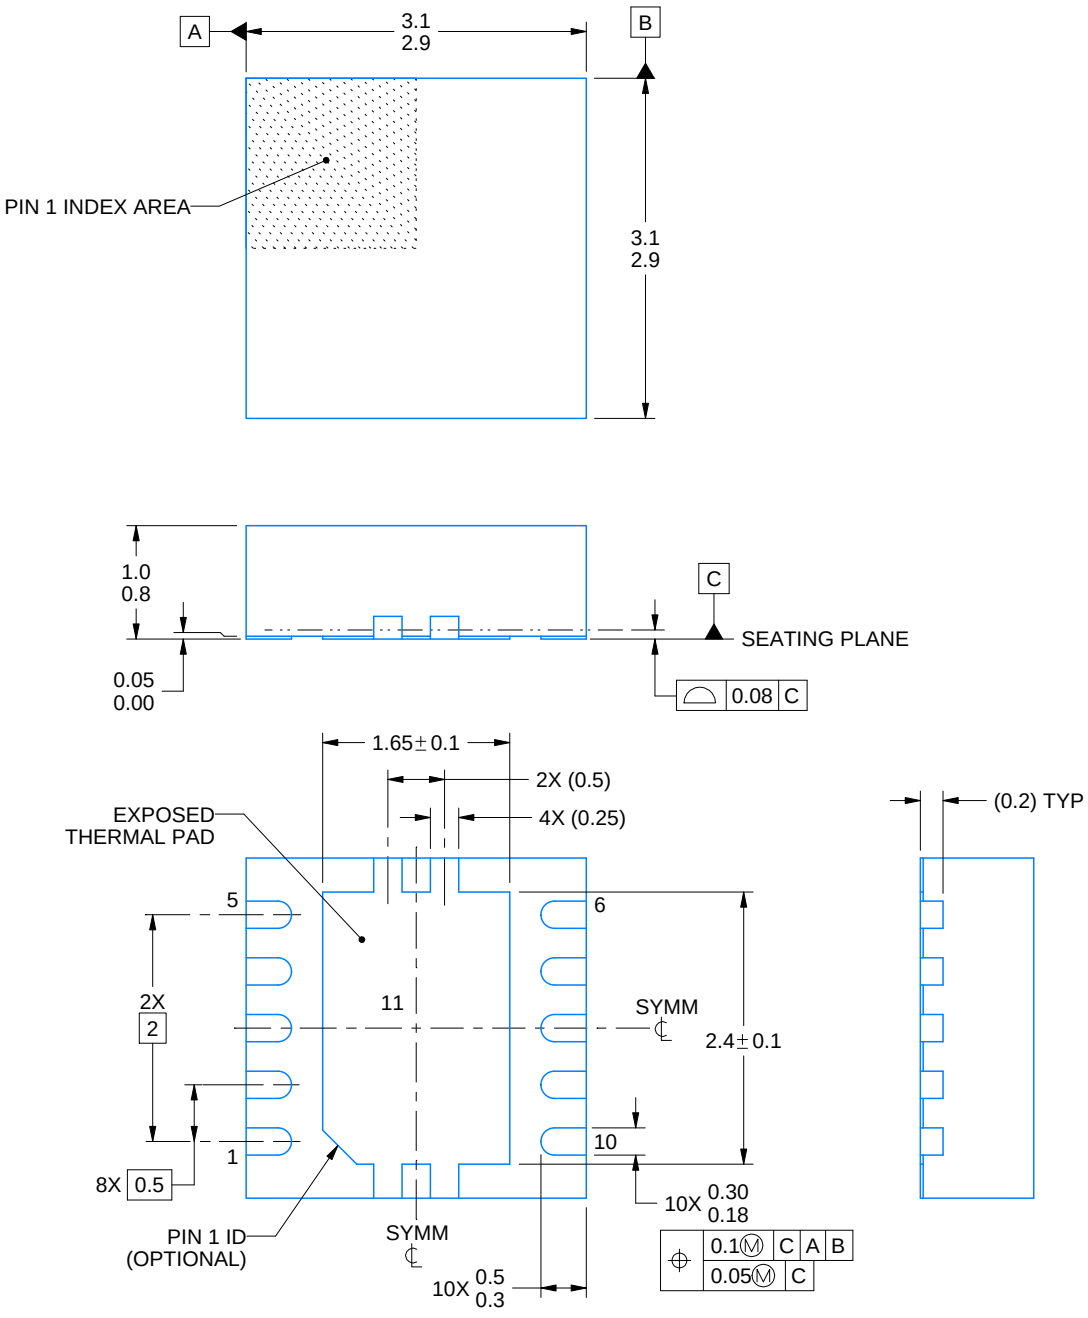
Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

DRC0010J

PACKAGE OUTLINE

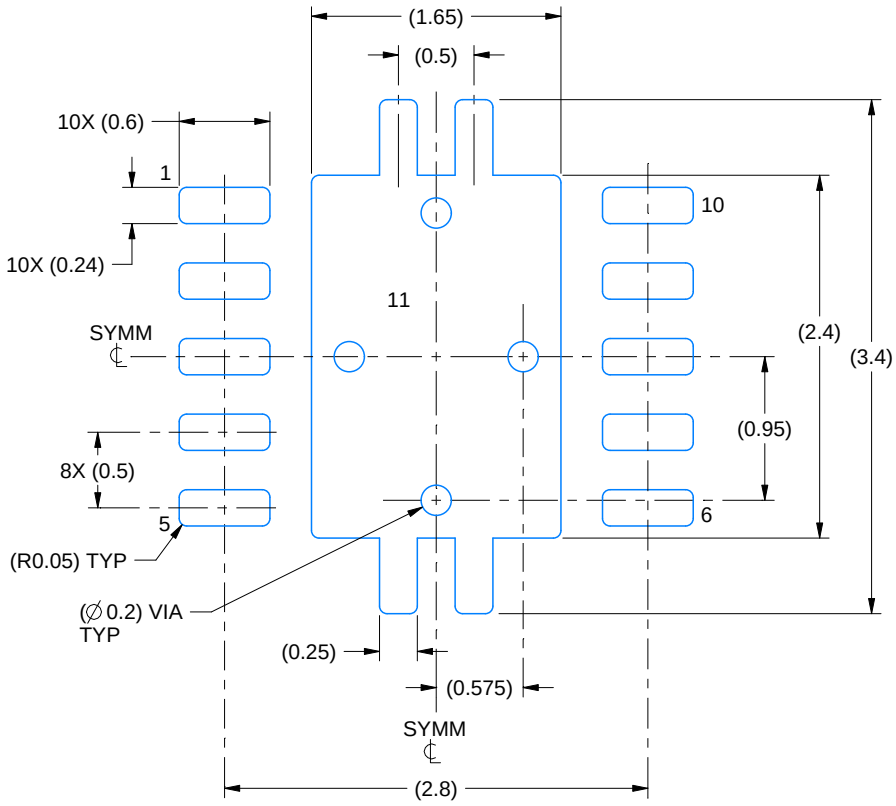
VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD



NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN

SOLDER MASK DETAILS

4218878/B 07/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

SCALE:10X

4221848/A 02/2015

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
