DATA SHEET

Si861x/2x Low-Power, Single- and Dual-Channel Digital Isolators

Skyworks' family of ultra-low-power digital isolators are CMOS devices offering substantial data rate, propagation delay, power, size, reliability, and external BOM advantages over legacy isolation technologies. The operating parameters of these products remain stable across wide temperature ranges and throughout device service life for ease of design and highly uniform performance. All device versions have Schmitt trigger inputs for high noise immunity and only require VDD bypass capacitors.

Data rates up to 150 Mbps are supported, and all devices achieve propagation delays of less than 10 ns.

Ordering options include a choice of isolation ratings (2.5, 3.75 and 5 kV) and a selectable fail-safe operating mode to control the default output state during power loss.

All products are safety certified by UL, CSA, VDE, and CQC, and products in wide-body packages support reinforced insulation withstanding up to 5 kV_{RMS}.

Automotive Grade is available for certain part numbers. These products are built using automotive-specific flows at all steps in the manufacturing process to ensure the robustness and low defectivity required for automotive applications.

Industrial Applications

- Industrial automation systems
- Medical electronics
- Isolated switch mode supplies
- Isolated ADC, DAC
- Motor control
- Power inverters
- Communications systems

Automotive Applications

- Onboard chargers
- Battery management systems
- Charging stations
- Traction inverters
- Hybrid electric vehicles
- Battery electric vehicles

Safety Regulatory Approvals

- UL 1577 recognized
  - Up to 5000 V_{RMS} for one minute
- CSA approval
  - IEC 62368-1, 60601-1 (reinforced insulation)
- VDE certification conformity
  - Si862xxT options certified to reinforced per VDE 0884-10 and 62368-1
  - All other options certified to VDE 0884-10 (basic) and 62368-1 (reinforced)
- CQC certification approval
  - GB4943.1

Key Features

- High-speed operation
  - DC to 150 Mbps
- No start-up initialization required
- Wide operating supply voltage
  - 2.5–5.5 V
- Up to 5000 V_{RMS} isolation
- Reinforced VDE 0884-10, 10 kV surge-capable (Si862xxT)
- 60-year life at rated working voltage
- High electromagnetic immunity
- Ultra low power (typical)
  - 5 V Operation
    - 1.6 mA per channel at 1 Mbps
    - 5.5 mA per channel at 100 Mbps
  - 2.5 V Operation
    - 1.5 mA per channel at 1 Mbps
    - 3.5 mA per channel at 100 Mbps
- Schmitt trigger inputs
- Selectable fail-safe mode
  - Default high or low output (ordering option)
- Precise timing (typical)
  - 10 ns propagation delay
  - 1.5 ns pulse width distortion
  - 0.5 ns channel-channel skew
  - 2 ns propagation delay skew
  - 5 ns minimum pulse width
- Transient immunity 50 kV/µs
- AEC-Q100 qualification
- Wide temperature range
  - –40 to 125 °C
- RoHS-compliant packages
  - WB SOIC-16
  - SOIC-8
- Automotive-grade OPNs available
  - AIAG compliant PPAP documentation support
  - IMDS and CAMDS listing support

Skyworks Green™ products are compliant with all applicable legislation and are halogen-free. For additional information, refer to *Skyworks Definition of Green™*, document number SQ04–0074.

3. System Overview

3.1. Theory of Operation

The operation of an Si861x/2x channel is analogous to that of an opto coupler, except an RF carrier is modulated instead of light. This simple architecture provides a robust isolated data path and requires no special considerations or initialization at start-up. A simplified block diagram for a single Si861x/2x channel is shown in Figure 1.

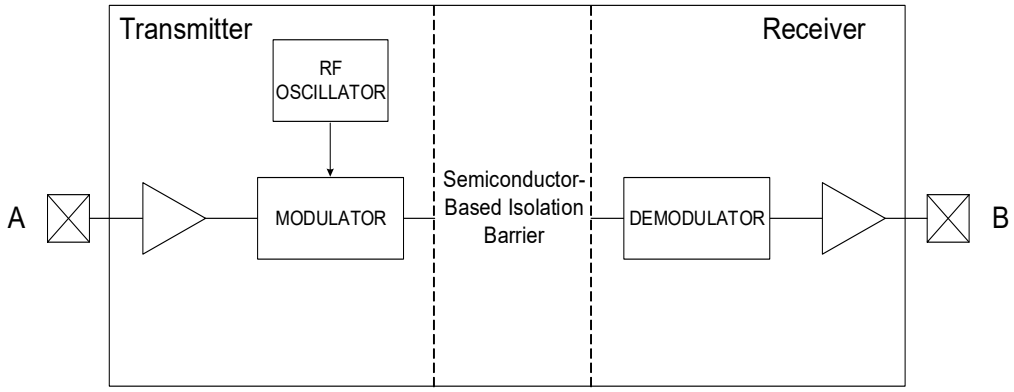

Figure 1. Simplified Channel Diagram

A channel consists of an RF Transmitter and RF Receiver separated by a semiconductor-based isolation barrier. Referring to the transmitter, input A modulates the carrier provided by an RF oscillator using on/off keying. The Receiver contains a demodulator that decodes the input state according to its RF energy content and applies the result to output B via the output driver. This RF on/off keying scheme is superior to pulse code schemes as it provides best-in-class noise immunity, low power consumption, and improved immunity to magnetic fields. See Figure 2 for more details.

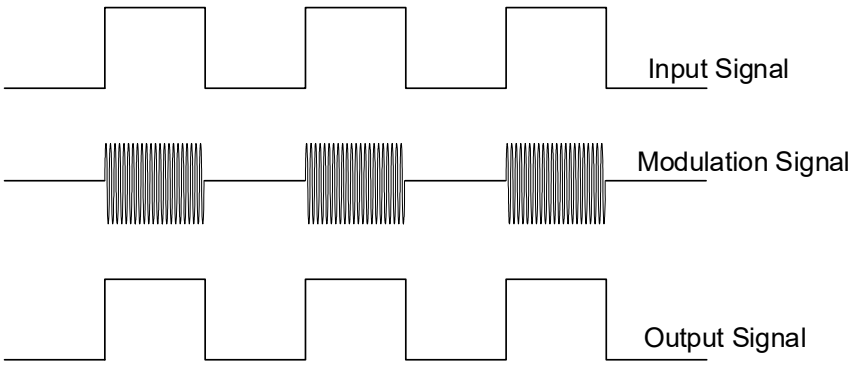

Figure 2. Modulation Scheme

3.2. Eye Diagram

Figure 3 illustrates an eye diagram taken on an Si8610. For the data source, the test used an Anritsu (MP1763C) Pulse Pattern Generator set to 1000 ns/div. The output of the generator's clock and data from an Si8610 were captured on an oscilloscope. The results illustrate that data integrity was maintained even at the high data rate of 150 Mbps. The results also show that 2 ns pulse width distortion and 350 ps peak jitter were exhibited.

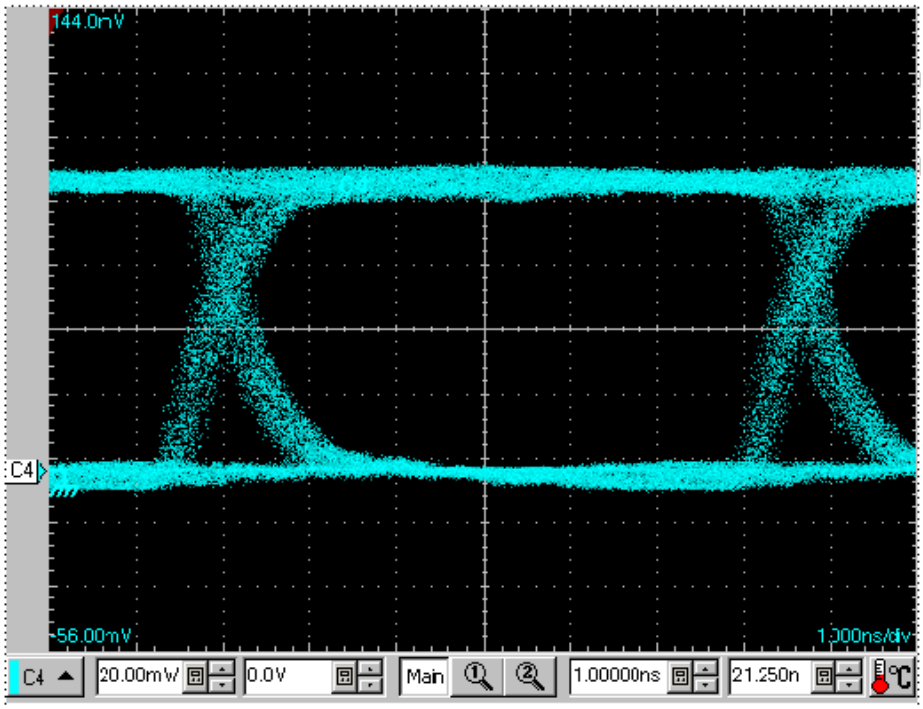

Figure 3. Eye Diagram

4. Device Operation

Device behavior during start-up, normal operation, and shutdown is shown in Figure 4, "Device Behavior during Normal Operation," on page 6, where UVLO+ and UVLO– are the respective positive-going and negative-going thresholds. Refer to Table 3 to determine outputs when power supply (VDD) is not present.

Table 3. Si86xx Logic Operation

V_I Input[1,2]	VDDI State[1,3,4]	VDDO State[1,3,4]	V_O Output[1,2]	Comments
H	P	P	H	Normal operation.
L	P	P	L	
X[5]	UP	P	L[6] H[6]	Upon transition of VDDI from unpowered to powered, V_O returns to the same state as V_I in less than 1 µs.
X[5]	P	UP	Undetermined	Upon transition of VDDO from unpowered to powered, V_O returns to the same state as V_I within 1 µs.

1. VDDI and VDDO are the input and output power supplies. VI and VO are the respective input and output terminals.
2. X = not applicable; H = Logic High; L = Logic Low; Hi-Z = High Impedance.
3. "Powered" state (P) is defined as 2.5 V < VDD < 5.5 V.
4. "Unpowered" state (UP) is defined as VDD = 0 V.
5. Note that an I/O can power the die for a given side through an internal diode if its source has adequate current.
6. See "1. Ordering Guide" on page 2 for details. This is the selectable fail-safe operating mode (ordering option). Some devices have default output state = H, and some have default output state = L, depending on the ordering part number (OPN). For default high devices, the data channels have pull-ups on inputs/outputs. For default low devices, the data channels have pull-downs on inputs/outputs.

4.1. Device Startup

Outputs are held low during powerup until VDD is above the UVLO threshold for time period tSTART. Following this, the outputs follow the states of inputs.

4.2. Undervoltage Lockout

Undervoltage Lockout (UVLO) is provided to prevent erroneous operation during device startup and shutdown or when VDD is below its specified operating circuits range. Both Side A and Side B each have their own undervoltage lockout monitors. Each side can enter or exit UVLO independently. For example, Side A unconditionally enters UVLO when V_{DD1} falls below $V_{DD1(UVLO–)}$ and exits UVLO when V_{DD1} rises above $V_{DD1(UVLO+)}$. Side B operates the same as Side A with respect to its V_{DD2} supply.

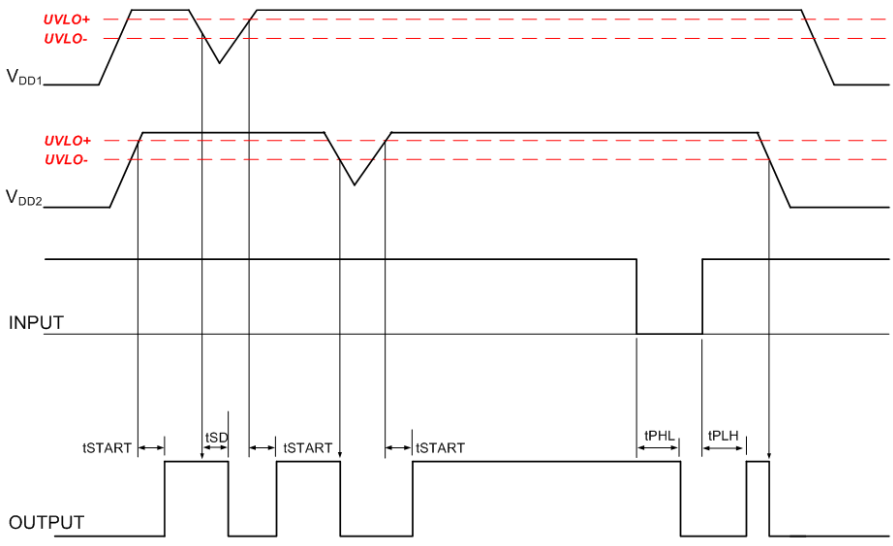

Figure 4. Device Behavior during Normal Operation

4.3. Layout Recommendations

To ensure safety in the end-user application, high-voltage circuits (i.e., circuits with >30 V_{AC}) must be physically separated from the safety extra-low-voltage circuits (SELV is a circuit with <30 V_{AC}) by a certain distance (creepage/clearance). If a component, such as a digital isolator, straddles this isolation barrier, it must meet those creepage/clearance requirements and also provide a sufficiently large high-voltage breakdown protection rating (commonly referred to as working voltage protection). Table 8, "Insulation and Safety-Related Specifications," on page 18 and Table 10, "VDE 0884-10 Insulation Characteristics," on page 18 detail the working voltage and creepage/clearance capabilities of the Si86xx. These tables also detail the component standards (UL1577, IEC60747-17), which are readily accepted by certification bodies to provide proof for end-system specifications requirements. Refer to the end-system specification (61010-1, 62368-1, 60601-1, etc.) requirements before starting any design that uses a digital isolator.

4.3.1. Supply Bypass

The Si861x/2x family requires a 0.1 µF bypass capacitor between V_{DD1} and GND1 and V_{DD2} and GND2.
The capacitor should be placed as close as possible to the package. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy.

4.3.2. Output Pin Termination

The nominal output impedance of an isolator driver channel is approximately 50 Ω, ±40%, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET.
When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled impedance PCB traces.

4.4. Fail-Safe Operating Mode

Si86xx devices feature a selectable (by ordering option) mode whereby the default output state (when the input supply is unpowered) can either be a logic high or logic low when the output supply is powered.
See "13. Ordering Guide" on page 27 and Table 3, "Si86xx Logic Operation," on page 6 for more information.

4.5. Typical Performance Characteristis

The typical performance characteristics depicted in the following diagrams are for information purposes only. Refer to "1. Ordering Guide" on page 2 for actual specification limits.

5. Electrical Specifications

Table 4. Absolute Maximum Ratings[1]

Parameter	Symbol	Min	Max	Unit
Storage temperature[2]	T_{STG}	–65	150	°C
Operating temperature	T_A	–40	125	°C
Junction temperature	T_J	—	150	°C
Supply voltage	V_{DD1}, V_{DD2}	–0.5	7.0	V
Input voltage	V_I	–0.5	V_{DD} + 0.5	V
Output voltage	V_O	–0.5	V_{DD} + 0.5	V
Output current drive channel	I_O	—	10	mA
Lead solder temperature (10 s)		—	260	°C

1. Exposure to maximum rating conditions for extended periods may reduce device reliability. Exceeding any of the limits listed here may result in permanent damage to the device.
2. VDE certifies storage temperature from –40 to 150 °C.

ESD Handling: Industry-standard ESD handling precautions must be adhered to at all times to avoid damage to this device.

Table 5. Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Ambient operating temperature[1]	TA	–40	25	125[1]	°C
Supply voltage	VDD1	2.5	—	5.5	V
	VDD2	2.5	—	5.5	V

1. The maximum ambient temperature is dependent on data frequency, output loading, number of operating channels, and supply voltage.

1. V_{DD1} = 3.3 V ±10%; V_{DD2} = 3.3 V ±10%, T_A = –40 to 125 °C
2. The nominal output impedance of an isolator driver channel is approximately 50 Ω, ±40%, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled-impedance PCB traces.
3. $t_{PSK(P-P)}$ is the magnitude of the difference in propagation delay times measured between different units operating at the same supply voltages, load, and ambient temperature.
4. Start-up time is the time period from the application of power to the appearance of valid data at the output.

6. Safety Certifications and Specifications

Table 9. Regulatory Information[1,2,3,4]

For All Product Options Except Si86xxxT
CSA
The Si861x/2x is certified under CSA. For more details, see Master Contract File 232873.
62368-1: Up to 600 V_{RMS} reinforced insulation working voltage; up to 1000 V_{RMS} basic insulation working voltage.
60601-1: Up to 125 V_{RMS} reinforced insulation working voltage; up to 380 V_{RMS} basic insulation working voltage.
VDE
The Si861x/2x is certified according to VDD 0884-10. For more details, see File 5028467.
VDD 0884-10: Up to 1200 Vpeak for basic insulation working voltage.
62368-1: Up to 600 V_{RMS} reinforced insulation working voltage; up to 1000 V_{RMS} basic insulation working voltage.
UL
The Si861x/2x is certified under UL1577 component recognition program. For more details, see File E257455.
Rated up to 5000 V_{RMS} isolation voltage for basic protection.
CQC
The Si861x/2x is certified under GB4943.1.
Rated up to 600 V_{RMS} reinforced insulation working voltage; up to 1000 V_{RMS} basic insulation working voltage.
For All Si86xxxT Product Options
CSA
Certified under CSA. For more details, see Master Contract File 232873.
62368-1: Up to 600 V_{RMS} reinforced insulation working voltage; up to 1000 V_{RMS} basic insulation working voltage.
VDE
Certified according to VDE 0884-10.
UL
Certified under UL1577 component recognition program. For more details, see File E257455.
Rated up to 5000 V_{RMS} isolation voltage for basic protection.
CQC
Certified under GB4943.1.
Rated up to 600 V_{RMS} reinforced insulation working voltage; up to 1000 V_{RMS} basic insulation working voltage.

1. Regulatory Certifications apply to 2.5 kV_{RMS} rated devices, which are production tested to 3.0 kV_{RMS} for 1 s.
2. Regulatory Certifications apply to 3.75 kV_{RMS} rated devices, which are production tested to 4.5 kV_{RMS} for 1 s.
3. Regulatory Certifications apply to 5.0 kV_{RMS} rated devices, which are production tested to 6.0 kV_{RMS} for 1 s.

Table 10. Insulation and Safety-Related Specifications

Parameter	Symbol	Test Condition	Value		Unit
			WB SOIC-16	SOIC-8	
Nominal external air gap (clearance)[1]	CLR		8.0	4.9	mm
Nominal external tracking (creepage)[1]	CPG		8.0	4.01	mm
Minimum internal gap (internal clearance)	DTI		0.014	0.014	mm
Tracking resistance	PTI or CTI	IEC60112	600	600	V_{RMS}
Erosion depth	ED		0.019	0.019	mm
Resistance (input-output)[2]	R_{IO}		10^{12}	10^{12}	W
Capacitance (input-output)[2]	C_{IO}	f = 1 MHz	2.0	2.0	pF
Input capacitance[3]	C_I		4.0	4.0	pF

1. The values in this table correspond to the nominal creepage and clearance values. VDE certifies the clearance and creepage limits as 4.7 mm minimum for the SOIC-8 package and 8.5 mm minimum for the WB SOIC-16 package. UL does not impose a clearance and creepage minimum for component-level certifications. CSA certifies the clearance and creepage limits as 3.9 mm minimum for the SOIC-8 and 7.6 mm minimum for the WB SOIC-16 package.
2. To determine resistance and capacitance, the Si86xx is converted into a 2-terminal device. All pins on the side 1 are shorted together to form the first terminal, the same is done with side 2 to form the second terminal. The parameters are then measured between these two terminals.
3. Measured from input pin to ground.

13.1. Industrial and Automotive Grade OPNs

Industrial-grade devices (part numbers having an "-I" in their suffix) are built using well-controlled, high-quality manufacturing flows to ensure robustness and reliability. Qualifications are compliant with JEDEC, and defect reduction methodologies are applied across the definition, design, evaluation, qualification, and mass production steps.

Automotive-grade devices (part numbers having an "-A" in their suffix) are built using automotive-specific flows at all steps in the manufacturing process to ensure robustness and low defectivity. These devices are supported with AIAG-compliant Production Part Approval Process (PPAP) documentation, and feature International Material Data System (IMDS) and China Automotive Material Data System (CAMDS) listing. Qualifications are compliant with AEC-Q100, and a zero-defect methodology is maintained throughout the definition, design, evaluation, qualification, and mass production steps.

See "11. Top Marking: WB SOIC-16" on page 33 and "12. Top Marking: SOIC-8" on page 35 for part number decoders.

1. All packages are RoHS-compliant with peak reflow temperatures of 260 °C according to the JEDEC industry standard classifications and peak solder temperatures
2. “Si” and “SI” are used interchangeably.
3. The temperature range is –40 to +125 °C.
4. An “R” at the end of the part number denotes tape and reel packaging option.
5. Automotive-Grade devices (with an "–A" suffix) are identical in construction materials, topside marking, and electrical parameters to their Industrial-Grade (with an "–I" suffix) version counterparts. Automotive-Grade products are produced utilizing full automotive process flows and additional statistical process controls throughout the manufacturing flow. The Automotive-Grade part number is included on shipping labels.
6. In the top markings of each device, the Manufacturing Code represented by either “RTTTTT” or “TTTTTT” contains as its first character a letter in the range N through Z to indicate Automotive-Grade.

14. Revision History

Revision	Date	Description
B	September, 2023	Removed “-IM1” part numbers and references to DFN-8 package.
A	July, 2022	Added Agile data sheet revision in footer.
1.76	December, 2020	Added DFN-8 package option. Corrected typos in VT+, VT– and V_{HYS} values in Table 8, “Electrical Characteristics,” on page 16. Standardized package designations across document.
1.75	September, 2019	Updated Ordering Guide.
1.74	October, 2018	Updated the Ordering Guide for Automotive-Grade OPN options.
1.73	May, 2018	Updated the Ordering Guide for Automotive-Grade OPN options.
1.72	April, 2018	Added Si8610ED-AS to Ordering Guide for Automotive-Grade OPN options.
1.71		Added new table to Ordering Guide for Automotive-Grade OPN options.
1.7		Added following note to Ordering Guide: “An “R” at the end of the part number denotes tape and reel packaging option.”
1.6		Added product options Si862xxT in Ordering Guide. Added spec line items for Input Leakage Current pertaining to Si862xxT in Ordering Guide. Updated IEC 60747-5-2 to IEC 60747-5-5 in all instances in document.
1.5		Updated Table 5 on page 17. Added CQC certificate numbers. Updated "5. Ordering Guide" on page 11. Removed references to moisture sensitivity levels. Removed Note 2.
1.4		Added Figure 2, “Common Mode Transient Immunity Test Circuit,” on page 8. Added references to CQC throughout. Added references to 2.5 kV_{RMS} devices throughout. Updated "5. Ordering Guide" on page 11. Updated "10.1. WB SOIC-16 Top Marking" on page 18.
1.3		Updated Table 11 on page 21. Added junction temperature spec. Updated "2.3.1. Supply Bypass" on page 6. Removed “3.3.2. Pin Connections” on page 22. Updated "5. Ordering Guide" on page 11. Removed Rev A devices. Updated "6. Package Outline: WB SOIC-16" on page 13. Updated Top Marks. Added revision description.
1.2		Updated Table 1 on page 4. Deleted reference to EN. Updated "5. Ordering Guide" on page 11 to include MSL2A.
1.1		Updated High Level Output Voltage VOH to 3.1 V in Table 3, “Electrical Characteristics,” on page 9. Updated High Level Output Voltage VOH to 2.3 V in Table 4, “Electrical Characteristics,” on page 13.
1.0		Updated “Table 3. Electrical Characteristics”. Reordered spec tables to conform to new convention. Removed “pending” throughout document.
0.3		Added chip graphics on page 1. Updated Table 6, “Insulation and Safety-Related Specifications,” on page 18. Updated Table 8, “IEC 60747-5-5 Insulation Characteristics for Si86xxxx*,” on page 19. Updated "3. Pin Descriptions (WB SOIC-16)" on page 9. Updated "4. Pin Descriptions (SOIC-8)" on page 10. Updated "5. Ordering Guide" on page 11.
0.2		Added chip graphics on page 1. Moved Tables 1 and 11 to page 21. Updated Table 6, “Insulation and Safety-Related Specifications,” on page 18. Updated Table 8, “IEC 60747-5-5 Insulation Characteristics for Si86xxxx*,” on page 19. Moved Table 1 to page 4. Moved “Typical Performance Characteristics” to page 7. Updated "3. Pin Descriptions (WB SOIC-16)" on page 9. Updated "4. Pin Descriptions (SOIC-8)" on page 10. Updated "5. Ordering Guide" on page 11.
