NCP81075DR2G**

Dual MOSFET Gate Driver, High Performance

NCP81075

Introduction

The NCP81075 is a high performance dual MOSFET gate driver optimized to drive the gates of both high and low side power MOSFETs in a synchronous buck converter. The NCP81075 uses an on-chip bootstrap diode to eliminate the external discrete diode. A high floating top driver design can accommodate HB voltage as high as 180 V. The low-side and high-side are independently controlled and match to 4 ns between the turn-on and turn-off of each other. Independent Under-Voltage lockout is provided for the high side and low side driver forcing the output low when the drive voltage is below a specific threshold.

Features

- Drives Two N-Channel MOSFETs in High-Side and Low-Side Configuration
- Floating Top Driver Accommodates Boost Voltage up to 180 V
- Switching Frequency up to 1 MHz
- 20 ns Propagation Delay Times
- 4 A Sink, 4 A Source Output Currents
- 8 ns Rise / 7 ns Fall Times with 1000 pF Load
- UVLO Protection
- Specified from -40°C to 140°C
- Offered in SOIC-8 (D), DFN8 (MN), WDFN10 (MT) Packages
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Telecom and Datacom
- Isolated Non-Isolated Power Supply Architectures
- Class D Audio Amplifiers
- Two Switch and Active Clamp Forward Converters

NCP81075

Table 1. PIN DESCRIPTION

Pin No. SOIC/DFN8	Pin No. WDFN10	Symbol	Description
1	1	VDD	Positive Supply to the Lower Gate Driver
2	2	HB	High Side Bootstrap Supply
3	3	HO	High Side Output
4	4	HS	High-Side Source
5	7	HI	High-Side Input
6	8	LI	Low-Side Input
7	9	VSS	Negative Supply Return
8	10	LO	Low-Side Output
-	5,6	NC	No Connect

Table 2. MAXIMUM RATINGS

Parameter		Value	Units
VDD		-0.3 to 24	V
V _{HB}		-0.3 to 200	V
V _{HO}	DC	V _{HS} - 0.3 to V _{HB} + 0.3	V
	Repetitive Pulse < 100 ns	V _{HS} - 2 to V _{HB} + 0.3, (V _{HB} - V _{HS} < 24)	
V _{HS}	DC	-20 to 200 - VDD	V
V _{LO}	DC	-0.3 to VDD + 0.3	V
	Repetitive pulse < 100 ns	-2 to VDD + 0.3	
V _{HI} , V _{LI}		-10 to 24	V
V _{HB} - HS		-0.3 to 24	V
Operating Junction Temperature Range, T _J		-40 to 170	°C
Storage Temperature, T _{STG}		-65 to 150	°C
Lead Temperature (Soldering, 10 sec)		+300	°C
HBM		1000	V
CDM		2000	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. V_{HB} - V_{HS} should be in the range of -0.3 V to +20 V.

Table 3. RECOMMENDED OPERATING CONDITIONS

Parameter		Min	Nom	Max	Units
V _{DD}	Supply Voltage Range	8.5	12	20	V
V _{HS}	Voltage on HS (DC)	-10		180 - VDD	
V _{HB}	Voltage on HB	V _{HS} + 8, V _{DD} - 1		V _{HS} + 20, 180	
	Voltage Slew Rate on HS			50	V / ns
T _J	Operating Junction Temperature Range	-40		+140	°C
V _{HO}		V _{HS} - 0.3		V _{HB} + 0.3	V
V _{LO}		-0.3		V _{DD} + 0.3	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

APPLICATION INFORMATION

The NCP81075 is a high performance dual MOSFET gate driver optimized for driving the gates of both high side and low side power MOSFETs in a synchronous buck converter topology. A high and a Low input signals are all that is required to properly drive the high side and low side MOSFETs.

Low-Side Driver

The low side driver is designed to drive low $R_{DS(ON)}$ N-channel MOSFETs. The typical output resistances for the driver are 1.5 ohms for sourcing and 1 ohm for sinking gate current. Due to the parasitic inductances of the packages, drive circuits and the nonlinearity of the MOSFETs output resistances the recorded peak current is close to 4 A.

The low output resistances allow the driver to have 8 ns rise and 7 ns fall times into a 1 nF load. When the driver is enabled, the driver's output is in phase with LI. When the NCP81075 is disabled, the low side gate is held low.

High-Side Driver

The high side driver is designed to drive a floating low $R_{DS(ON)}$ N-channel MOSFET. The output resistances for the driver are 1.5 ohms for sourcing and 1 ohm for sinking gate current. The bias voltage for the high side driver is realized by an external bootstrap supply circuit which is connected between the HB and HS Pins.

The bootstrap circuit is comprised of only the bootstrap capacitor since the bootstrap diode is internal. When the NCP81075 is starting up, the HS Pin is at ground, the bootstrap capacitor will charge up to VDD through the internal diode. When the HI goes high, the high side driver will begin to turn the high side MOSFET On by pulling charge out of the bootstrap capacitor. As the external MOSFET turns ON, the HS Pin will rise up to V_{IN} , forcing the HB Pin to $V_{IN} + V_{BstCap}$ which is enough gate to source voltage to hold the switch On. To complete the cycle, the MOSFET is switched OFF by pulling the gate down to the voltage at the HS Pin. When the low side MOSFET turns On, the HS Pin is pulled to ground. This allows the bootstrap capacitor to charge up to VDD again. The high-side driver's output is in phase with the HI input. When the driver is disabled, the high side gate is held low.

Unlike a Buck regulator at power-up, Boost regulators typically require starting when the HS pin is at the V_{IN} level, instead of GND or the prevailing V_{OUT} . Care should be

taken by the system designer to pre-charge the bootstrap capacitor (C_{BST}) to ensure sufficient voltage levels for proper operation. If the capacitor is discharged, the high-side power MOSFET relies on the driver's internal 20 k Ω pull down resistor to prevent charge from building up across its V_{GS} during the initial low side FET turn on events. High dV/dt on HS, when turning on the low-side MOSFET, creates a capacitive divider across the high side FET gate, possibly resulting in cross-conduction. With proper biasing across C_{BST} ($V_{HB} - V_{HS}$), the internal low-impedance pull down at HO ensures the high-side FET remains off.

The external BST resistor, which connects HB pin and BST cap, should avoid excessive resistance. NCP81075 has high-side UVLO protection based on the voltage across HB and HS pins. High resistance on HB pin may falsely trigger UVLO protection at the moment when high-side MOSFET is turning on.

UVLO (Under Voltage Lockout)

The bias supplies of the high-side and low-side drivers have UVLO protection. The VDD UVLO disables both drivers when the VDD voltage crosses the specified threshold. The typical rising threshold is 7.1 V with 0.58 V hysteresis. The VHB UVLO disables only the high-side driver when the VHB to VHS is below the specified threshold. The typical VHB UVLO rising threshold is 6.5 V with 0.5 V hysteresis. The designer must take into account a 40 μ s delay before the output channels can react to a logic input. (Refer to the UVLO Timing Diagram).

Input Stages

The input stage of the NCP81075 is TTL compatible. The logic rising threshold level is 2.4 V and the logic falling threshold is 1.6 V.

Layout Guidelines

Gate drivers experience high di/dt during the switching transitions. So, the inductance at the gate drive traces must be minimized to avoid excessive ringing on the switch node. Gate drive traces should be kept as short and wide (> 20 mil) as practical. The input capacitor must be placed as close as possible to the IC. Connect the VSS pin of the NCP81075 as close as possible to the source of the lower MOSFET. The use of vias is highly desirable to maximize thermal conduction away from driver.

DESCRIPTION:	SOIC-8 NB	PAGE 2 OF 2

onsemi and **ONSEMI** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
